I would like to monitor (receive-only) a Baudot data stream and display the characters on a Radio Shack Model 100 for ease of portability. It seems to me that the bar code wand input port to the Model 100 would be an ideal way to get access to a data stream (through a suitable polar or neutral to TTL converter circuit, which I would furnish).

Does anyone have any software to do this using the above or any other input means for the Model 100? I have very little experience with the Model 100 other than to use it as a portable terminal, I don't have an assembler for it, and I *detest* BASIC - so I am not inclined to write it myself.

Thanks to any who respond.

Our amateur radio club is installing a 440 MHz repeater. We will be building our own computer-based controller, but want to buy the transmitter and receiver. Possible options are :

1. Cannibalize a commercial solid-state mobile radio (GE, Motorola, etc.)
2. ICOM IC-RP3010 UHF Repeater
3. SPECTRUM COMMUNICATIONS Transmitter and Receiver (SCR450A, SCT410B)
4. Duplexers: either WACOM or TX/RX SYSTEMS

Does anyone have experience with any of these (or other UHF repeaters)? Any good deals out there ?

Any comments or suggestions on UHF transceivers, handie-talkies, etc. will also be appreciated.

The use of circular polarization is television broadcasting has been, as far as I know, restricted to certain subscription stations operating in the UHF band. By transmitting with, for example, right-hand circular-polarization and equipping the receivers with a similar antenna, they can effect considerable attenuation of odd-number reflection ghosts, since these would have opposite polarization sense. And actually, it is really just the first reflection that is a problem, second, third... bounces are usually too far attenuated to create a visible problem. Actually, the visual aspect of the problem is only secondary to the technical problem of decoding suppressed-synch type scrambled transmissions. Multipath makes decoding a stable image more difficult.

Now, in the case of broadcast FM stations, some proportion of the carrier is transmitted in both the horizontal and vertical planes. This is mostly as a concession to mobile receivers that commonly posses vertical whip antennas.

FCC records are available from the US National Technical Information Service in three forms:

1. Microfiche - catalog PR-718-1 contains all of the FCC datafiles that are available on microfiche from NTIS.

2. Magnetic tape - catalog PR-718-2 contains all of the FCC datafiles that are available on magnetic tape from NTIS. EBCDIC tapes are available in 7 track 1600 bpi, and 9 track 800, 1600, or 6250

bpi.

3. 5.25" floppy diskette in ASCII format, compatible with the IBM-PC. I don't think a catalog is available yet, so call the NTIS if interested in floppies.

Call the NTIS at (703)254-7160 for the catalogs or other information.

I think microfiche is the cheapest media, cheaper yet if you buy the set Bob Grove sells at about $150. The magnetic tape version is available from NTIS for over $7200.00!

Been procrastinating about getting your broken Bearcat 250 scanner repaired? You had better do it quickly, or else it may be impossible to fix.

I've been asked to repair a few defective Bearcat 250s with the same complaint: the LED display is blank, except for a single decimal point in the lower right hand corner. This usually means something in the switching power supply chain is defective.

Part of this chain contains IC6, an Exar NC57902 custom divider chip, Electra part #NC57-902. Uniden just discontinued this part, so I couldn't repair the last 250 in for service.

Just before this custom IC was discontinued, a quantity of these ICs were bought by an authorized Bearcat repair agent, Electronic Repair Center, in Franklin Park, Illinois. This facility won't sell Bearcat parts, but they will repair your scanner for a flat fee.

It's already too late for those of you wishing factory service for your BC101, Bearcat's first synthesized scanner. Bearcat will not service this unit as the main CPU, a custom IC, is no longer available. Luckily, the last BC101 I repaired (on the morning of my wedding) had a good CPU.

I also have a Bearcat 210 with a bad IC6. Uniden
told me that the part was unavailable but they
would send a form for a 50% discount on a
new scanner. I received the form and found these
prices to be no bargin. The ads in QST
match or beat these prices. So lets thank
Bearcat Uniden for leaving us old customers
out in the cold.

Unfortunately, non-cellular mobile phone services occupy a rather small
slice of spectrum. However, the general area of 800-1000 MHz (inside of
which cellular services reside) could be interesting to look at for a
digital data service.

Since I only received my license again in August, I can't give you much
of a recommendation on paddles, but I thought I would mention that I just
built an 8044 keyer from scratch. My wife gave me a Meisel Music paddle
for Christmas so that's what I am using right now.

I am sure that it may not be as good as the Bencher or Vibroplex, but I got
a good price on it! One thing is for sure--it does beat my J38 and old bug
that I once used!

Hope to catch you on CW someday.

I posted the original of Mr. Stoners letter to usenet, and I'll forward
all respones to him.

All comments are appreciated, both pro and con.

For the record, I've gotten information that the ARRL will oppose
this proposal.

Finally, I'll reread the original and other documents that I didn't post
to usenet and any that are relevent, I will post here. I didn't post
them all before, but I see a need now as there seems to be the feeling
here that we are 'giving up' a section of the spectrum when the feeling
from the other documents is that this will not be a surrender, just that
there would be an additional service, as it would require a license to
operate but that would be allowed under technician and higher class
license. In other words, this would be a new 'no code' license for
'digital' use only. I personally think it is a great vehicle for enticing

new blood into the HAM ranks, as newcomers will get a taste of the RF spectrum and then want to move up to VHF high or UHF once they get their TECH license, or into HF if they learn more than the minimum code.

I have a Pioneer CTF900 Cassette Player that has developed an annoying click in the output to my amplifier. It doesn't matter whether the tape has anything recorded on it or not, so I am tending to shy away from the record portion of the circuitry. The beast is so complex that before I go too far and wished I hadn't, I thought that I would poll the net to see if anyone has had a static click appear on their machine, and if they found or knew the fix. (The click seems to be at random intervals and affects both channels).

Thanks for your help and if I stumble across the solution I will query the net to see if anyone else needs it.

x

Several weeks ago, I posted a list of low power, FCC-licensed stations which broadcast information of interest to travelers.

A search of federal IRAC records unearthed another list of stations which provide the same type of services. These are operated by agencies of the United States Government and are not under FCC jurisdiction.

> tions to use right-hand circular polarization. Furthermore, the
> FCC allowed the TV stations to run the old ERP limit in both

FM radio stations were always allowed to use "circular polarisation" in a sense, being permitted "any power divider you want" and the same ERP in the horizontal and vertical planes (actually, the vertical plane couldn't be more than the horizontal). No one, (except idiots who buy antennas out of the back of "Radio World") but no one, would dare not use CP for FM. Note that if the power divider and antenna combination was a Hilbert transformer (in effect) - 90 degree lag between the H and V antennas - CP would be obtained.

Virtually all new builds for TV also use the RH circular polarisation, at VHF this is typically the CBR (tm) - cavity backed radiator type of antenna. Three (or six) of these are put on the tower face(s) and fed with equal power; the pattern circularity obtained is excellent. Thus, the trend to higher power VHF television transmitters...one disadvantage of the CBR antenna is that it has very little gain and is very expensive. In actual use, there is *no comparison* between the old Batwing antenna and a CBR installation at WFMY-TV (2) Greensboro, NC.

The CBR (and other CP antennas for VHF) have unbelieveably good VSWR characteristics, usually less than 1.1:1 over the entire low or high VHF band (!). A properly pruned CBR installation can support two or three TV stations in a market. The break even point is about 2.2 TV stations on a CBR installation (and about four FM stations on a "panel radiator" thingie which is similar to the CBR).

> I don't know of any stations that actually run the limits. The most
> powerful station that I know of is Channel 68 (WQTV, I believe) in
> Boston at 1.3 MW ERP.
>
There are more than a few UHF stations at 5 mw ERP:

WGGT Greensboro, NC (48) - 1800 feet and 5 mw
WNRW Winston Salem (45) - 1940 feet and 5 mw
New TV Belmont NC   (44) - 2000 feet and 5 mw

The most "powerful" TV station in the US (i.e. the one running the limits with the least antenna gain) is WTIC Hartford CT (62?) which has - count 'em - 5 Varian klystrons at 220 kw visual. They are also 5 mw ERP. I'm sure the guy who changes the tower lights can feel this, and birds flying by probably drop to the ground.

However, you guys in the civilized world (known also as Zone 1) are permitted the EIRP limits only to 500 feet, while we are permitted the

same ERP up to 2000 feet. Thus, the Boston station probably has more
than a 500 foot tower.

    I might add that ghost discrimination (the whole reason for circular
polarisation) is still about 9 - 13 dB improved with CP over regular
horizontal polarisation, even when the receiving antenna is horizontal
only. However, your mileage may vary at UHF. Millions of people with
wabbit ears like CP as well.

David Anthony
DataSpan, Inc.

I am also using the Hi-Mound key from Meisel Music, but I think it
is better than the Vibroplex which it replaced. Beautiful construction,
and much better price. Also it is a twin paddle, squeeze keyer, whereas
the old vibro keyer was not iambic. Vibroplex does make a n iambic
model now, however.

I'm looking for a four or five foot dish for WX satellite work. Has
anyone on the net been down this road before and if so what suggestions
do you have?

Specifics: F/D = .4 to .6
            lighter weight preferred
            .5 inch peak to peak surface deviation max
            operating freq = 1.691 Ghz.
            no feed or mounting hardware required
            lowest possible cost (naturally- otherwise this would
               be easy!) < $200

Regards,
Randy Davison

Some years ago i was able to restore, by the seat of my pants, an old
Hammarlund SP-600 receiver. At that time the only documentation i could
find on the beast came from the public library in the form of some ancient
type of *photo-facts* the name of which i don't recall. Although this really
did help, it was generic in nature and not too close to the SP-600 i own.

I'm looking for a manual that may be closer to my receiver than the infor-
mation i've got. The model number is SP-600-JX-17, serial number 16825.
If any body can help or point me in the right direction i'd really
appreciate it.

thanks,
kenb

My favorite paddle was homemade (by my father PA0JKG). It was completely
free of backlash or play because it basically consisted of two paddles
hinged at the back by broad leaf springs. Maybe someday he or I will
write it up...

I once tried the Vibroplex paddle. Perhaps it was misadjusted, but it
felt like a piece of garbage. Loose bearings and generally unpleasant.
Considering their reputation, I was quite surprised; now I wouldn't
even consider one. In fact, any mechanism that needs adjustment to be
free from play isn't designed right. (The Bencher passes on that test
judging by the picture; I've never tried one.)

I seem to have lost my own paddle in the last move, but when I start
looking for one again I'll probably start with the homemade kind, and
only if I run into trouble with that would I consider buying one.

A CW/RTTY/ASCII program, "HAM", has been developed for the APPLE II/e.
"HAM" may be used to receive CW/BAUDOT/ASCII without the use of a
Terminal Unit (TU) or inhance the features of any TU for both
Transmission and Reception. For the SWL, ham's transmit features are
inhibited. For the licensed amateur, the FCC Callsign is embeded.

"HAM" features;
* CW - 5-99 WPM, Auto- Speed & Character tracking, speed readout.
* BAUDOT & ASCII - 50 baud to 19.2 Kilobaud.
* Two sets of nine 256 bit programmable message buffers.
* A 1k type-ahead transmit buffer and a 4K recallable receive buffer.
* Multi-window display, top receive-center status-bottom transmit.
* Automatic word wrap-around on receive display window.
* Operator selection of either 40 or 80 column display (w/APPLE Board).
* Operator selection of window allocation on the CRT.
* Displayed clock for time-of-day or elapsed time.

"HAM" is available from TCI Communications Inc., 67 Clark Place,
Colonia, N.J. 07067 at $49.95 per copy. Please send check or money
order with photocopy of FCC Amateur license. SWL, receive only, programs
will be upgraded to full transmit & receive with presentation of copy of
FCC Amateur license for a $5.00 fee.

Scanner Survey: Bearcat

Bob Parnass, AJ9S

800XLT: 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC350: 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular, now discontinued. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkard to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC300, and at a lower price.

BC300: 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC20/20: 40 channels. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250: 50 channel discontinued model. Rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and ciruit board. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260: Super heavy duty metal cabinetry and lighted controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Method of connecting an external speaker is awkward.

BC100: First programmable portable. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused bat-tery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC101: First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available.

These are USENET news groups. I can't help with net.audio but
net.music is distributed to ARPA land by INFO-MUSIC-REQUEST@HI-MULTICS.

See if you can order a service manual for a Realistic DX400
from Radio Shack. It's a CR2021 clone.

/* End of text from npqc:net.ham-radio */

This service manual is available from Radio Shack, One of the better
ones too, I must say. It is 72 pages with fold out schematic, and
sells for $8.25. Part Number is MS-2000207, catalog# 20-207.

Parts orders or quotes: Radio Shack National Parts

900 E. Northside Dr.
Ft. Worth, TX 76102

To whomever was asking about keyer paddles:

Well, it has been a while since I pounded brass regularly. I still copy
it a lot (W1AW machine-sent bulletins) but don't send much. My top
speed was 25 WPM.

Back when I did use CW enough to want a good keyer paddle, I asked
K2KIR what he recommended - being a CW traffic hound. He suggested
one made by Brown Brothers (of St Louis, as I recall). I got one
and never regretted it. It is very solid, feels great, less filling,
no problems at all. It's iambic (though I learned on a keyer before
iambics were common, so I don't use it that way).

I haven't seen an ad for one in a long time, so I don't know whether
they are available any more or not.   If so, I recommend them.

Scanner Survey: Regency

Bob Parnass, AJ9S

K500: Nice wood-like cabinet. Discontinued 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500, but now discontinued. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlighted keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: Current, 30 channel replacement for M400, but basic features only. Nice lighted keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner, and the most scanner for the money ($180 typical discount price).

M100: Discontinued 10 channel unit. Same as MX3000 except different color and fewer channels. Nice lighted keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

In reference to Will Martin's comments, I have missed Glenn Hauser's
"World of Radio" too. It is not as interesting as it used to be and he
does not give that many DX tips, but there are tid-bits of information.

I heard it the other night, Friday night (EST) Sat morning (UTC) at
0400 on 6185 khz. Aparently WRNO did have transmitter problems and
did not broadcast the program on the weekend on 1/4. WRNO seems to be
very sporatic as they are on and off the air.

I did not get a chance to listen Saturday night or Sunday morning, so
I don't know if the program was broadcast or not.

The following is a letter I put together for distribution at hamfests and club
meetings etc. I used to be the assistant net manager of a 2m traffic net and
used to do a lot of traffic handling "advertising."

I'm posting this letter because it seems there is a recent lack of interest in
traffic handling -- especially CW traffic handling. Fewer and fewer new people
are joining in. Is it computers...packet...??? All are worthwhile. Regardless
of the reason, it's still a real shame that more people aren't giving traffic

handling a try too.

New faces are welcome everywhere. There are CW, Phone, 2m FM, and RTTY nets (to name a few) to satisfy anyone's taste. All would love to have a few new faces.

Traffic handling sharpens radio communication skills and is excellent practice for emergencies. But most of all it's just plain fun!

Please take time to read the letter and let me know what you think. The letter talks about CW traffic handling but really applies to all modes in general. I have more information that I'd be happy to send to anyone who is interested. If you've never received a Radiogram, send me your address and phone number and I'll send you one. (a great way to get in touch with some local traffic handlers)

THE QUESTION:

Are you looking for something different in Amateur Radio? Maybe getting tired of the same, "standardized" QSO's: RST, name, QTH and WX? Or maybe the thrill of working DX isn't the same as it used to be.

THE ANSWER:

Give CW traffic handling a try! ! ! !
--

"Oh no! not CW! I don't even know if I can receive at five words per minute any more. And I've heard that those code nets run at about 40 words per minute -- I'll stick to VHF and HF phone..."

Does this sound like you? If it does you're missing out on one of the nicest and most enjoyable aspects of Amateur Radio. And believe it or not, EVERYONE starts out at five words per minute at one time or another.

A GREAT WAY TO START:

There are many "Slow Speed Nets" or "Novice Nets" which are specifically designed for the new comer to CW traffic

handling which are just waiting for you to check in. EVERY net which I have come in contact with always loves to have new people check in. And you won't be alone because there are many other amateurs just like you who are new to CW traffic handling. Slow Speed Nets are not exclusively for new comers either. Many seasoned CW traffic handlers check into the slow speed nets to act as an example to help the new comers and mostly because it is just plane fun! Getting to know these people can be very interesting and fun. All of the traffic handlers I know are glad to help with questions and advice. You may even find new friends right in your local area who share your new found interest.

For example, one such net (my personal favorite) is The Empire Slow Speed Net. ESS covers New York State and the surrounding area and meets at 3.590 Mhz at six O'clock Eastern Time. It is an independent net which means it is not formally affiliated with the ARRL sponsored National Traffic System but has close links with the NTS nets so messages can be handled to any US or Canadian destination.

As is transmitted each time the net begins: "EMPIRE SLOW SPEED NET FOR TRAFFIC AND TRAINING ALL STATIONS WELCOME." If you check in just once a month the net manager W2WSS in New York City will send you a newsletter which is PACKED with lots of interesting information about CW traffic handling and traffic handling in general. There is no commitment made by checking in and you can check in as often as you like. That's another nice thing about traffic handling; you can participate whenever it is convenient for you.

If you are still a little leery about checking in just listen to a few net sessions to see how it goes. That way you'll eliminate your anxiety and hopefully peak your curiosity. Listening or checking into a CW traffic net is probably the best way to increase your code speed too. Listening to code tapes can get boring because it's the same meaningless text over and over again. CW nets are live! No two net sessions are alike! This makes copying interesting and fun. Based on my own experience, I'm sure that you'll be amazed at how fast your speed picks up. BUT SPEED IS NOT IMPORTANT!!!

Don't be afraid to give it a try. The Net Control Station (the station which runs the net) will slow down to your speed and will repeat anything you miss. Believe me they don't mind slowing down. Rather they will be glad to see a new station checking in for the first time. Don't worry about making mistakes. Remember this is fun! Everyone has made each mistake at least once before they learned.

For more information I highly recommend reading a two page article from the December 1976 QST titled "Checking into

Slow-Speed Nets." The article gives a brief synopsis of how the nets are structured and how to check in. If you don't save old copies of QST the article is reprinted in the back of the ARRL's "Net Directory." The Net Directory is a listing of most all net frequencies and times in the US, Canada, and many parts of the world. They are available from the American Radio Relay League for $1.00 either at their booth at most hamfests or by mail from their headquarters (255 Main Street, Newington, CT., 06111). Consult the Net Directory to find the meeting time and frequency of a CW net in your area. Or ask around on a local repeater or at a club meeting for suggestions. There is a lot of help and information out there just for the asking.

I have put together a file with excerpts from "Checking into Slow-Speed Nets." Send me a mail message and I'll send it to you along with the answers (I'll do my best) to any questions you might have.

Hopefully I've managed to peak your interest. "The more the merrier" really holds true for traffic handling. Hope to hear you on the net soon.

Good luck and 73,

Philip KA2QIK/1

>agency answering 911 calls - which is only proper, since a given central office
>will often serve more than one political subdivision.
>
>==> Larry Lippman @ Recognition Research Corp., Clarence, New York   <==

An interesting aspect of this is related to mobile phones. What is the PROPER public safety agency for mobile phones? Enhanced 911 was recently installed in Phoenix, and we discovered that when we called it from our Ham Radio Autopatch system, the operators sometimes would not believe us because we reported incidents 20 miles from the "originating address"! With the increased sales of cellular phones, this problem will increase.

The solution used in Phoenix is to program those numbers into the system so that they show up as "mobile", and to route them to the county sherrif's office rather than the jurisdiction of the "originating address".

Another problem is that 911 operators often read back the number calling. Our autopatch numbers are secret to prevent people from dialing them and tying up the system.

Oh well...

(controller stuff)	(complete rpt, or less cntl's)
Spectrum	
(215-631-1770)	
(boards, cmplt rptr's)	

I suggest you call them , get All the info then decide, I am the Technical person on a machine w/ abt 150 members, and only qualify to answer about spectrum.(censored)Actually i think there receiver, and xmtr boards are ok, but OVERPRICED, as far as their power supplys, well i'd be happy to get more than a year before they checkout. not the best designed i've seen, my schematics are filled with changes They've made. Their autopatch boards are "old as dirt" logic, have to retune 567's when room heats in summer. I've said enough , you get the point.

I've just researched what your about to and i think i'm going to go with micro control, they were the only ones that sent me a schematic without asking for one, also asked me if i'd like names and numbers of others in my area using them, to ask what they thought of the stuff. I'm impressed with the receiver spec's, reads as the best on the market, i'm skeptical of most but this one looks GOOD, and I cant afford less than the best receiver. The transmitter seems well engineered also, their machines are the only ones that i know of that have a deviation, meter as well as basic's. and their simple machine is abt 1200. not bad considering what spectrum wants for NOTHING. quiet tmos transmitter transistors, and 7 helical resonators in the receiver seem like an ok basis to build on.

Yaesu has a nice no meter simple machine for about 899 (w/o dtmf,ider etc, as you want) but the receiver scares me, the specs look poor, ie: ".5 or better" ?? i cant take a chance on the better. hi hi and the selectivity was about -6db at 15khz i think(maybe 12) but the kendecom receiver was abt -105! not bad, for same khz.(im talkin two meters now but if they cant do well on 2, can 440 be better?)

Well good luck, im going to drive up to the boston area in about a Month to pick it up(i've ordered one), and i'll let you know what the shop looks like up there, if you like. I've been to spectrum MANY times and i'm not impressed, a few years ago they were ok, but since i think all have left, and the new folks dont impress me on the phone. I Grilled the guy at kendecom and he still had the answers i wanted.

Next duplexers, never heard of tx/rx systems but, i know celwave/ phelps-dodge are harder to tune, and need 6 cavities, compared to wacom, I have 641 wacoms, just added 150w final and their still holdin their own. hi hi Wacom only uses 4 cavities, and has pass band tuning on top and reject freq. rods on side. EASY! to tune... And if you have any problem Kit Parsons WILL spend the time on the phone you need, EXELLENT customer service, nice club discounts. They get my vote.

One more thing, the icom repeater, well it looks good in the pix but try buying it without THEIR controller, and why waste the money when you want yours in there? also after reading the net lately, think i'll skip icom for a while. Too many back 4-6 times till fixed stories. hihi

Good luck and if you remember, let me know how you make out.

....es best 73's
...de ka2qhd
...johnd

Greatly appreciate comments on kendecom as theres still time to cancel. HI HI

>Back when I did use CW enough to want a good keyer paddle, I asked
>K2KIR what he recommended - being a CW traffic hound. He suggested
>one made by Brown Brothers (of St Louis, as I recall).

I own both a Brown Brothers and a Bencher paddle. My usage was for
QRQ (well, 35 wpm at least) ragchewing, traffic handling, and contests,
and my preference is now the Bencher. It's my pride and joy.

But both are very find paddles, and I believe you'll be happy with
either. It's probably a little like buying a word processor.

Regency (continued)

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad ham-
fests, often in poor condition. Don't pay more than $50,
even if mint. Front ends must be tuned for selected por-
tions within the bands for best sensitivity. Wide IF selec-
tivity troublesome in urban/suburban areas. Primitive digi-
tal scanning circuitry may become confused at times, but
power off/on restores sanity. Not all that bad a deal if cheap. Replaced by Regency ACT units.

WHAMO-10: Regency's first synthesized scanner. Discontin-
ued long ago. Appearance more like a crystal scanner, with
a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO
reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some com-
ponents difficult for servicing. Comb sockets prone to bad connections after moderate use.

My wife and I are looking for a good short wave radio.
We were told by a friend that Sony has two good ones out, one
for around $300 and one for around $200. Does anyone have any
recommendations? Also, where can the best prices be found?

I'd like to purchase one of these, at as low a price as is reasonable.
I'm looking for a used one, or a pointer to a discount supplier.

I've seen them advertised for $169.00.
I want to copy rtty and CW, for casual SWLing, without using a
dedicated computer system. I'm willing to consider other approaches.

In regards to recent Scanner Survey and Owner's Report articles, I don't receive sample scanners from manufacturers for evaluation. As a hobbyist, the equipment I review is that which I've purchased or repaired for myself or others, and had an opportunity to evaluate "hands-on".

If I haven't had enough experience with a particular model to make anything more than superficial remarks, I'm timid about writing a review.

I would enjoy reading articles by owners of

- Drake DSR2, ITT Mackay Marine, or TMC GPR90 general coverage receivers,

- Regency MX7000/MX5000 or Z-series scanners,

- JIL SX400 scanners,

- Bearcat 50XL portable scanners,

- other scanner or shortwave receivers,

- scanner antennas.

- receiver accessories (descramblers, tape recorder interfaces, broadcast band rejection filters, Fox-Tango IF filters, etc.)

How does your equipment perform? If you've encountered any equipment failures, what parts were defective? Was it difficult to repair? Have you found a way to "trick" it into doing something new?

Is anyone still actively using those older, tuneable pub-lic service monitor receivers, like the Radio Shack PRO-2B, early Regency Monitoradios, or Lafayette PF series? I've a shelf full of these vintage radios and collect more every hamfest.

I hope you enjoy reading this stuff as much as I like writing it. Thanks for your support.

Scanner Survey: Radio Shack
(made by General Research Electronics of Tokyo)

Bob Parnass, AJ9S

PRO2001: Early, discontinued single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: Discontinued 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Front mounted, vertical speaker always a win.

PRO2003: Radio Shack's top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warrantee, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable.
Covers the three basic bands, but no aircraft. Easy to
obtain batteries and crystals. Characteristic Radio Shack
squelch problem, fixable by changing one resistor. All-
plastic case larger than Bearcat Thin Scan and clones.

Keywords: DES, digital audio, scrambling, VideoCipher II, B-MAC, MDS
Xref: watmath net.analog:639 net.video:1921 net.ham-radio:3776
Summary: DES is used

HBO is using a scrambling device developed by MAccom/Linkabit called the VideoCipher II. It basicly denies unauthorized access to HBO satellite feeds by digitally scrambling the audio using a DES generated key stream, and makes watching the video more difficult by inverting it and removing all synchronizing pulses.

The Picture

Recovering video from a Videocipher enciphered satellite transmission requires little more than a source of sync genlocked to the basic horizontal and vertical scanning rates of the HBO transmission. As the 3.58 mhz color burst is still present (though not at the same DC level), obtaining a timing reference based on locking to the color burst is still quite possible.

Once one has a source of timing (a clock slaved to the transmitter clock) recovering correct sync phase can be handled by hand (IE push a button or turn a knob until the picture is right) or automatically by looking for the digital data which is substituted for the sync.

Adding the sync to the picture and inverting the video requires some very simple analog cicuitry.

The job of generating sync from an oscillator slaved to the color burst can be easily handled by one of several sync generator IC's. The required circuitry to recover a picture from a VideoCipher II transmission is not excessively complex and might well have been built for a few dollars from Radio Schlock parts.

The Problem

This is all fine if all one wishes to see is silent movies. But most people want to hear the movie as well as see it. And the sound is transmitted under DES encryption. There is no published method of breaking DES. MACom estimates that it would take "large" computational resources "uneconomic to apply to the problem" to determine the keys

that are used that are changed tens of times a second.

The system encodes its audio (in a 14 bit format similar to but not identical to that used on CDs), authorization information, and some extra bit stream capacity that may in the future be used for delivery of data services directly to satellite equiped homes as a 4 level pulse amplitude modulated bit stream that occupies the time interval that the horizontal and vertical sync occupy in a standard TV picture.

In addition to the two stereo audio channels, this bit stream includes authorization information addressed to a specific decoder box that contains a 56 bit (DES remember) bit map authorizing the user to receive one or more of 56 different service packages. A particular show is transmitted with a similar bit map that identifies which service packages it belongs in.

The actual DES keys used to encipher the audio stream are transmitted under a higher level key every few frames of video. That key in turn is transmitted under a per-show key, and that key is transmitted under a per service key. And the per-service key is sent to the user under a per-user decoder box key and changed once a month or so.
So rather than have one fixed key that enciphers the whole bit stream for hours or days at a time, the actual keys that are used to encipher repetitive patterned data such as the sound are randomly chosen and frequently changed.

Macom keeps the keys secure by building the entire decrypting process into one large VLSI chip which never puts out a key on any of it's pins. So obtaining the keys requires microprobing the chip (which clever metalization may well make impossible). Interestingly, they recognized the problems that could be caused by theft of a list of decoder box keys, so each decoder box has a number of different individual keys burned into it so that if one list is lost, they can simply switch to another.

The Result

It seems inconceivable to me that anyone has broken an apparently well thought out DES based audio encryption system with $12 of Radio Shack parts. I have never heard any information that would suggest that HBO built in a back door method of recovering audio such as an analog modulated subcarrier (similar to the normal method of transmitting audio on a satellite) so I suspect that all the person involved did was recover a watchable picture without sound which isn't very hard to do and is clearly not worth $10000.

VideoCipher I

Originally MAcom developed the Videocipher I which was a substantially more complex and expensive device intended for use

only by cable companies. It used DES psuedo-random address sequences to read individual chunks of video (portions of a line) out of a digital frame store. When it became obvious that a device was needed that could be sold to home viewers for a reasonable amount of money and work well with poor downlink receivers and poor signals it became clear that the VideoCipher I was excessive.

The VideoCipher I has been revived, however, to encipher CBS backhauls from remote studios and sports events back to CBS headquarters. I understand that CBS feels that other networks were pirating news stories by watching CBS feeds. I have not heard whether they intend to encipher all the feeds to their stations, but I doubt very much if they will get away with denying rural areas access to CBS programming so they will no doubt keep one open.

B-MAC

The other satellite TV scrambling system currently being marketed aggressively is B-MAC sold by Scientific Atlanta which also uses DES encoded audio (or something similar to DES). It, however, also uses DES to dither (delay by psuedo-random amount) the video and does not transmit the video in a normal NTSC format (rather it transmits the luma and two color components as separate pulses at a substantially higher effective scan rate and uses CCD or digital line store devices to combine them back into a NTSC color picture). As a result, B-MAC encoded video is much much harder to recover a watchable picture from.

B-MAC is scheduled to be used to encode the Holiday Inn Hi-Net 6 channel Ku band movie service (one channel of which may be HBO). Scientific Atlanta would love to be able to sell their scrambling system to the C-band cable system signal providers but MAcom got a head start with HBO and is strenuously arguing that TVRO users don't want to have to buy two $300 descrambler boxes. However the fact that the video isn't very secure with the MAcom system has been an issue and that may be why there has been some publicity about the subject.

The MDS Loophole

HBO transmits unenciphered video on so called multipoint distribution systems (2150 mhz) in more than 300 different metropoliten areas throughout the country. The modulation used is standard vestigal sideband AM with FM sound. All that is required to pirate HBO from such signals is a downconverter than converts the 2.15 GHZ to channel 3. Such downconverters used to be quite widely advertised for "Ham-TV" because a radio amateur band is nearby (2304 mhz).

Reception of MDS signals for the purpose of illegally obtaining HBO service has been found to be a violation of the Communications Act of 1934 in a recent Supreme Court decision. And of course the infamous "Electronic Communications Privacy Act of 1986" which is moving through congress may make any reception whatsoever of unauthorized signals whether out of idle

curiosity or fraudulent intent a serious federal felony equivalent to the present crime of wiretapping.

It is however amusing to note that 3 different networks I watched on the night HBO started full time scrambling all showed pictures of MDS antennas along with regular satellite dishes. The voice over said nothing about MDS but the tape clearly showed pictures of MDS antennas on all the network stories I watched. I suspect this was a quite and clever comment by the technical folk who shot the tape about the MDS loophole, as I doubt there are many broadcast technicians who can't tell the difference between an MDS antenna and a satellite dish.

In any case it is probably true that nearly as many if not more people pirate HBO from MDS links with equipment that sold for as little as $59 as those who used $3000 home TVRO's principly to cheat HBO of it's monthly subscription fee.

Being a pack rat all my life who could never stand to see "usable" items scrapped or otherwise discarded, I have a rather formidable collection of WECO data sets; most, if not all of these data sets are now MD-ed. Some of these data sets still have potential value to me for dedicated line use within our

buildings (like 108's, 201's, and 202's), but I am having difficulty in getting SD's, CD's and BSP data from my "usual" sources because these data sets are now MD-ed - even though some are only 4-5 years old.

Can anyone be of assistance in furnishing this information, or telling me where to obtain it? Since these data sets are no longer manufactured and are no longer competitive with state-of-the-art items, I would think that the supporting information (SD's, etc.) would no longer be considered proprietary by AT&T - so I do not believe that I am asking anyone to furnish proprietary information.

If there is a proper source in AT&T where I can formally request such information, I would appreciate being advised of where to contact; I will pay a reasonable document reproduction fee.

I will furnish a more specific list of what information I require upon request.

Thanks for anyone's assistance.

I can add a bit more on this; since WRNO was off the air due to continuing transmitter-tube problems on at least part of two weekends, on the weekend of 11-12 Jan, they broadcast three different World of Radio programs, one in each regularily-scheduled time slot, in order to catch up.

Unfortunately, the local-Saturday-evening (6:30 PM CST; 0030 GMT Sunday) broadcast on 7355 kHz is often unreadable here in St. Louis; either due to them transmitting on lower power at that time, or atmospherics and skip zones being bad for that frequency at that time on the path between New Orleans and St. Louis. [Other times, WRNO has boomed in on 7355; not so

lately.] The local-Friday-evening (10:30 PM CST; 0430 GMT Saturday) on 6185 kHz is not bad, but has been subject to much variation recently. The best is usually the Sunday-morning airing (8:00 AM CST; 1400 GMT Sunday) on 9715 kHz.

However, there is now another outlet -- World of Radio is also broadcast on KCBI Dallas; Fridays at 3:00 PM CST (2100 GMT), on 11790 kHz, when most working people would have to use a timer to tape it in their absence, and repeated on Sundays at 12:30 PM CST (1830 GMT) on 11925. [I may be wrong about this frequency, as I'm doing this from memory -- maybe 11905? It's whatever the regular frequency KCBI has been using before they switch to 11790 at 1900 GMT.] This last just began this week.

I've listened once to each KCBI broadcast -- the first Friday afternoon one on 27 Dec., when it came in great, and the first Sunday afternoon one on 19 Jan., when it was fairly poor, and only marginally readable.

(By the way, any propagation experts out there care to offer their opinions as to whether I have reasonable expectations or am expecting too much about these local US shortwave broadcasters? Being here in the heartland [St. Louis, MO], I have been expecting that I should get a good signal from any of them [WRNO, KCBI, and WHRI in Indiana, which is carrying Radio Earth now every evening at 0300 GMT on 7400 kHz] at any time of the day or night. This is not the case. Reception is often marginal, and I sometimes cannot tell if the station is off the air [like WRNO has been a lot recently] or if reception is just so poor that I can't make out any recognizable modulation.

Am I just too close to most of them, so that I am in their skip zone much of the time? Or are their antenna orientations putting nulls toward me? [That last might be quite likely for WHRI, which has a south-aimed antenna, while I am to their west.] Or is it just the wretched propagation we have been enduring lately?)

I believe that there exists, and i think from Kantronics, a "SWL"
equivalent to the UTU, which has the transmit portions of the box
removed, and probably has not been beefed up from a RFI
susceptibility standpoint. So, if you NEVER plan to use the beast
for transmitting, you might consider this. I will try to find the
ad i saw for this.

I have worked with UHF and VHF repeaters for about 10 years and have
had the pleasure of working with everything from top quality commercial
gear to the cheapest manufactured for ham use and homebrew as well as
many combinations of the above.
     I suggest that if your group can get hold of commercial quality
especially Motorola repeaters and accessories, that is the way
to go. They ain't cheap!
     If not, then unless you have four or five experienced electronic
and communications types with a room full of service monitors

and other commercial grade test equipment, the best thing to
do is to "write a check" for a system produced for amateur use.
The idea of building a state of the art system - or even just
the computer card for one - is no longer practical. Of course if
you just want to fool around and don't care how it works, then
you should please yourself. If on the other hand, you want a system
which you know will be up day after day and year after year, then I suggest you
follow the above. My group which includes the aforementioned experts and equipment
has built up a system which
we think is pretty great but it doesn't do half what some of
the new commercial systems in the back of QST or 73 magazine
now do. In addition it is a weekly maintennance job for three
or more men to keep it on the air. We do this because we think
it's fun but perhaps you would not. In brief, it is far easier
to raise a few thousand and put up a turnkey system than it
is to design, build, and maintain your own system. This is perhaps not what you
would wish (nor do I) but it is the truth.
As to the system you should choose, I suggest you check locally
to see what other groups are running and go look at the stuff
yourself. Lots of luck! Bob

'Tis true... Our VideoCipher II just came in yesterday, and I might just add that it is a very sophisticated piece of equipment.

First, the VideoCipher II is available in two models for "consumer" use: one, which accepts raw (nondeephasized video) or composite video, and the other, which allows looping through the 70 mHz IF signal from the satellite receiver. The version I had was the "looped through" version; both the consumer/SMATV versions have an RF modulator for channel 3 or 4. I believe that a wireless remote is available.

However, the person who is selling me my AUTHORIZED FOR HBO VideoCipher box (no flames) had it at home preauthorized, working fine, but when we connected it to our antenna last night, it wouldn't work. The help menu wouldn't come up or *nuthin'*. The VideoCipher box does depend on the reception of a VideoCipher-encoded audio data stream before the functions on the front panel would work; it may be that the Sat-Tec receiver we were using was too "narrow" to recover the audio clock and data properly from the synchronizing interval.

That's where it was left, last night. We are dropping back to punt, and when I get the SA 6603 receiver on the dish (and verification that the box is authorized) I'll post observations about the VideoCipher box to the net.

Adnan, the Sony receivers you were referring to are the ICF-2002 which sells for about $200 and the ICF-2010 which sells for about $279. I own

the 2002 and I'm very happy with it. It is very small and easily stuffed
in a briefcase or suitcase for travelling. I'm also happy with its
performance. It is quite sensitive even with the internal whip antenna
and really does well with an outdoor antenna. Of course being a small
portable radio it lacks features that a desk-top radio would have like
noise blankers, switchable if filters, etc. I don't know too much about
the 2010 other than it is the big brother to the 2002 and offers more
features. If I were going the spend the $200 for the 2002 I'd probably
just go the extra $79 or so for the nicer radio. (When I bought my 2002
the 2010 was just a sparkle in a Japanese designer's eye somewhere).
Good luck and I'm sure you'll enjoy either radio.

x
     Rumor has it that Regency will announce the HX1500,
     another version of the HX1000 and HX1200 portable
     scanners.

     The most important new feature in the HX1500 will be
     that its 45 channels are subdivided into 3 banks of 15
     channels each, and each bank may be enabled or dis-
     abled.

     The HX1000 is being discontinued, and the HX1200 is
     just an HX1000 with the addition of commercial aircraft
     band, direct channel access, but no clock.

January 02, 1986

The ARRL Letter is published bi-weekly by the Information Services Department of the American Radio Relay League, 225 Main St., Newington, CT, 06111; (203) 666-1541. Larry E. Price, W4RA, President; David Sumner, K1ZZ, Executive Vice President; Dave Newkirk, AK7M, Editor; Debra Chapor, Circulation Manager.

Information from The ARRL Letter may be reproduced in whole or part in any form including photoreproduction and electronic databanks, providing credit is given to The ARRL Letter and to the American Radio Relay League.

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds)

per year for First-Class Mailing to the U.S., Canada, and Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

The Executive Committee of the ARRL Board of Directors met in Atlanta, Georgia, on December 14, 1985. Here are highlights; the full minutes will appear in QST:

The Committee considered an ARRL position regarding RM-5241, the petition by Donald Stoner, W6TNS, for the creation of a Public Digital Radio Service (PDRS) and reallocation of the 52-54 MHz band from the Amateur Service to the PDRS. Counsel was directed to file comments by the deadline of January 6, 1985, vigorously opposing the reallocation of 52-54 MHz. (Details of RM-5241 elsewhere this Letter.)

Pertaining to Radio Frequency Interference (RFI), this resolution was unanimously adopted:

> Whereas, RF susceptibility of the current generation of VCRs and other home electronic devices is a growing
>
> problem; and
>
> Whereas, the public is not aware that responsibility for RF susceptibility of VCRs and other home electronic devices lies with the manu facturers of such equipment rather than with Amateur Radio stations operating in the vicinity of these devices; and
>
> Whereas, technical solutions -- while being pursued through special committees of the American National Standards Institute (e.g., ANSI C-63) and by other routes -- will not have a favorable impact on equipment reaching consumers in the near term; now,
>
> Therefore, Counsel is instructed to prepare for filing, after review at the 1986 Annual Meeting of the Board, a petition requiring the labelling of home electronic equipment, with regard to its susceptibility to RF energy, the filing to emphasize that such labelling is no substitute for technical solu tions in the longer term.

The Executive Committee completed its review of Morse Code examination procedures as called for at Minute 66 of the 1985 Second Meeting (see page 57, September 1985 QST). The EC concluded that there was no immediate need to revise the Rules in Part 97. However, the Executive Committee recognized that consistency of standards in the examination program continues to be a desirable objective, and the President is requested to continue to pursue this with Commission personnel as appropriate, keeping the Morse as well as the written test in mind.

Amateur recruitment. To increase the number of amateurs licensed by FCC will require a cross-disciplinary coordinated effort, which is difficult if not impossible through a separate Development Office. Thus the Development Office is being closed, and other organizational changes will be made. (See "HQ Shifts Gears," this Letter.) The following elements of an amateur recruitment program are contemplated for 1986:

a) An assertive effort through radio clubs.

b) Newsstand publication.

c) Use of a professional public relations firm for such projects as the placement of articles in non-amateur publications for targeted groups.

d) Cooperation with youth groups and senior-citizen organizations.

e) Revised instructor guides.

f) "How to Become" information tailored to the targeted groups.

The International Amateur Radio Union Secretary, David Sumner, K1ZZ, presented a brief oral report on the IARU Administrative Council meeting in Melbourne, Australia, and Auckland, New Zealand, November 8, 9 and 11, 1985. It was made clear that the Council's discussion of a possible World Administra tive Radio Conference in the early 1990s (as has been postulated by International Telecommunication Union Secretary General Richard Butler) in no way implied IARU endorsement of such a WARC being held.

HEADQUARTERS SHIFTS GEARS TO MEET GROWTH CHALLENGE

For the year 1985, ARRL enjoyed an in crease in membership of approximately 15,000. While this is short of the ambi tious goal of a 25,000 increase this year, +it's by far the largest

membership increase since the CB-boom year of 1977, and quite likely the largest in the League's history in a year that did not see a similar in crease in the number of licensed amateurs.

The continuation of this success on the membership front will require more than a "rerun" of 1985 techniques. The reason for this is that we've yet to make any measurable progress on the recruitment front -- that's "recruitment" as in more radio amateurs. Figures for upgrading from one license class to another look promising, but the rate of first-time entry into Amateur Radio actually declined in the FCC fiscal year ending September 30, with similar results for October and November. More radio amateurs means a stronger Amateur Radio in government eyes.

ARRL's Executive Vice President has determined that the revised HQ organizational structure, adopted last year (see "HQ Reorganization" in the January 17, 1985 Letter), has not given the League the best means of tackling the recruitment task. Writes EVP David Sumner, K1ZZ: "The only effective way to deal with a challenge as large as Amateur Radio recruitment is to mobilize all the available resources, regardless of the department in which they may happen to reside. Assigning the respon sibility to a single office, with a relatively small staff, doesn't get the job done unless there is some mechanism for tapping into the resources of other departments. Accordingly, as we close out the year we have set the wheels in motion for a reorganizing of the development function, to focus our resources as effectively as possible on the recruitment challenge." How will HQ respond to this challenge?

The Development office is being phased out. Existing

personnel in Newington will continue to perform their functions (training, audio/visual, referrals of prospective hams to clubs and Elmers, etc.) but will be reassigned to a new Club Services Department in the Volunteer Resources Group.

The membership promotion function is reassigned to the Publications Group, and more specifically to the Circulation Department.

The function of providing support to the section-level and local Public Information Assistants and Public Information Officers will be assigned to the Club Services Department.

Coordination of the recruitment function will become a staff function in the office of the Executive Vice President, through the chairing of a multi-department Task Force on Recruitment. It will be the mission of the Task Force to develop a detailed recruitment plan, including specific task assignments to departments.

Representing the League to the national media also will be

done by the office of the Executive Vice President. Several personnel shifts are being made to complete the picture:

Joining the EVP's staff in mid-January as Senior Staff Advisor for Planning and Operations is Karl Muller, W3UBQ. Karl recently took early retirement after a 35-year career with Gulf Oil, and is relocating to Connecticut from Houston. His background in financial and customer service operations will add considerable depth to the staff.

Curt Holsopple, K9CH, will become Manager of the new Club Services Department, effective the first of the year.

Jim Clary, WB9IHH, Assistant Manager of the Volunteer Examiner Department, will become Manager of the department.

Watch this space for more news as ARRL tackles the challenge of the eighties. Hint: you're the most important part of it.

PUBLIC DIGITAL RADIO SERVICE WOULD GOBBLE HALF OF SIX-METER BAND

What has one watt, four letters and wants to eat two megahertz? Answer: the PDRS (Public Digital Radio Service) sought for in a Petition for Rulemaking (RM-5241), brought before FCC by Donald L. Stoner, W6TNS. Citing the rising popularity and falling prices of computers, and juxtaposing these with increasing costs for telephone service, Stoner proposes that the PDRS would permit the owners of personal computers to communicate by radio, first through Local Area Networks (LAN) and, beyond LANs, through a national packet radio network. Transmitter power would be limited to a maximum of one watt in a given user's "radio modem," with output power being adjusted automatically to the minimum needed for communication. There's one immediate hitch, from Amateur Radio's point of view. Writes the petitioner:

"A wideband digital channel can only be accommodated with the VHF band or higher frequencies. To keep the cost of equipment low, a band between 30 and 300 MHz is ideal. Some readers may feel that a service as described should be placed in the UHF or SHF range. This might be true if a suitable allocation within the 30-300 MHz band did not exist.

"However, within this frequency range there is a band, 2 MHz in width, which is virtually unoccupied and therefore unused. I refer to the spectrum between 52 and 54 MHz.

"Radio amateurs are permitted to operate on frequencies between 50 and 54 MHz (the six meter band). For a number of reasons, this band is 'underoccupied.' It is estimated that out of 400,000 radio amateurs in the United States, less than 1000 are active on the six meter band . . . "

The opinion of the petitioner is that most amateur operation is confined to the bottom two MHz of "Six" because of television interference; the proposed low power used by "radio modems" in the PDRS would obviate their causing TVI. Check an ARRL Repeater Directory lately? 52-54 MHz is where repeaters reside on six, and they're doing quite well, thanks.

Next Letter, we'll detail ARRL's response to RM-5241; the League's Executive Committee has already made the gist of its position known (see "EC Meeting," this Let ter). It's not the proposal for the service that's the bone of contention, understand -- it's just that Amateur Radio intends to go right on keeping that top two megahertz of six exclusively within the Amateur Radio realm.

ARRL FOUNDATION SCHOLARSHIPS AVAILABLE

The ARRL Foundation announces the availability of three scholarship awards for the 1986-87 school year. Based on high academic standing, financial need and dedi cation to public service through Amateur Radio, these awards are provided through the generosity of individual sponsors and donors:

The Perry F. Hadlock Memorial Scholar ship of $500 will be awarded to a student of electrical engineering. It is open to licensed radio amateurs of the General, or higher, class.

The Paul and Helen L. Grauer award of $500 will be given to a student of electronics, communications engi neering or related fields who resides in and attends an accredited college or university in the Midwest Division of the ARRL.

The You Have a Friend in Pennsylvania scholarship is available for the first time in the l986-87 academic year. It will be awarded to a League member who maintains academic excellence.

Further information and application forms for these awards may be obtained by writing to the ARRL Foundation Scholarships, 225 Main Street, Newington CT 06111.

COMMISSION UPHOLDS DENIAL OF PROPOSAL TO ESTABLISH AUXILIARY MONITORING SERVICE IN ALL RADIO SERVICES

In 1982, Congress amended the Communica tions Act to authorize the Commission to use volunteers in the Amateur and

Citizens Band Radio Services to monitor violations of the Communications Act and FCC rules. In the fall of 1984, a volunteer Amateur Auxiliary was established pursuant to an agreement with ARRL concerning the training and administration of the auxiliary. The pur pose of the Amateur Auxiliary is to foster wider knowledge of Commission rules, conduct monitoring of the Amateur Radio Service frequencies to encourage compliance with the rules and good operating practices, develop solutions to problems arising from the operation of amateur stations, and to under take specific projects as the need arises.

FCC has upheld a staff decision denying a proposal by John P. Weber, Jr., K4JW, Melbourne, Florida, to establish a volunteer auxiliary monitoring service in all radio services. Weber proposed an auxiliary monitoring service in all radio services involving volunteers working under direct FCC supervision. The Chief, Field Operations Bureau (FOB), denied the petition on the basis that Congress had only authorized the Commission to use volunteers in the Amateur and Citizens Band Radio Ser vices; that federal law precludes such voluntary and uncompensated service other than in these two services; that the Communications Act prohibits the intercep tion and disclosure of radio signals by volunteers in most other radio services; that establishment of an auxiliary for all radio services at once would be too broad and ambitious a project for for effective FCC oversight and supervision; and that since the Commission's regulatory emphasis in a number of services has concerned signal analysis, the expense of appropriate equip ment and necessary training may be prohibi tive.

As part of his application for review, Weber contended, among other matters, that under his proposal there was no need for an intermediate organization such as the ARRL, and that volunteers would be considered agents of the Commission and protected by federal law. He further contended that the FOB-ARRL agreement violated the procedural requirements of the Government in the Sunshine Act, could cause violations of federal and Florida laws concerning the interception and disclosure of oral communications, and had practical problems regarding reimbursement by the ARRL for certain volunteer monitoring

expenses, travel expenses, and participation by all interested amateurs. Weber asserted that the ARRL does not speak for the majority of amateurs, and that his proposal would result in a more effective volunteer organization for the benefit of the Commission.

The Commission found no merit in the further contentions raised by Weber in his application for review. It noted that the most efficient development of an amateur volunteer auxiliary is through large organi zations such as the ARRL, particularly when such organizations bring with them extensive experience with prior self-regulation ef forts and other volunteer experience. It

noted further that the Amateur Auxiliary is a Commission program to be administered, in large measure, by the ARRL and any other national or regional organization that has a similar type of agreement with FOB. It stated that the Amateur Auxiliary is still in its developmental stage and that FOB will be monitoring its effectiveness in accomplishing the Congressional intent in authorizing the volunteer service.

(K4JW became a Silent Key before FCC's denial was released -- Editor.)

YOU USE YOUR CALL, WE'LL USE OURS

In June of last year it came to the League's attention that a low-power TV station in Columbus, Ohio, was visually identi fying as W8BV. The real W8BV is Stuart M. Brooks of Portland, Michigan; the assigned callsign of the LPTV station is W08BV. It's a no-no for LPTV stations to omit the "leading zero" from their calls, as directed by Section 74.783(d) of the Rules:

> The channel number designator for Channels 3 through 9 will be incorpo rated in the call sign as a 2-digit number, i.e., 02, 03, . . . so as to avoid similarities with call signs assigned to amateur radio stations.

As late as November 4, 1985, the W8BV callsign was still being used by the LPTV station. However, a November 19 report by ARRL's Washington Area Coordinator brought the news that the LPTV had finally cleaned up its act -- with the new logo's zero looking more like an "O." QRA?

NEW CONTEST CERTIFICATES ON THE WAY

The ARRL Contest Branch has new contest certificates on the drawing board -- this has put our normal certificate mailings behind their usual schedule. A sneak peek over the necessary shoulder indicates the revised articles will be well worth a few more weeks' wait: 8-1/2 by 11 inches and horizontal format with screened map backgrounds. Stand by!

IT'S ALL OVER BUT THE QSLING

Results of the December 28-29 W1AW bash: 809 phone QSOs, 732 CW -- a total of 1541! We even enjoyed a little late-night "E" on 10. QSLs answered 100% -- let's have yours!

A while back I found and baught a microwave diode??? of some type from a
used electronics store im Palo Alto Ca. and I was wondering if any one out
there can give some info on the type of diode it is and any other info on it.
it is a Microwace Associates MA4968. the test data that came with it is

C6 .429
Tl 10ns
Ts .09ns
Fc-6 400ghz
Vb 38v
the diode is in a package that is like a weding cake the bottom layer is
about .125 in in diameter and .010 thich gold plated. the next layer is glass
about .050 in dia and .050 tall. the top layer is .010 in dia and .050 tall.

the types of things that it could be used for would be appreacetd.

thanks in advance.

The bottom line is: continued appearance of want ads on this net will
result in the severance of the Usenet<-->Arpanet gateway of
net.ham-radio<-->Info-Hams. I don't think anyone wants to see the
free flow of information between the two cease.

> Has anyone on line ever heard of the cactus network?
> eaters linked? 73s......Dave n2aam

I have not heard of the cactus network but I HAVE heard of the DRONK
network when I was in San Diego, Ca. (1979-1981). The DRONK net was a
series of closed private repeaters (PL) on two meters and above which
were linked together like a private phone system and could be controled
via touch tone codes.

The network was very private. I met a couple of the people on it and they
were of the type that if anyone tried to get onto any of their repeaters

who did not belong to the group they would trace them down and beat them
up and I mean beat them up. They are a good group to stay away from; at
least back in '79. Hopefully things have changed by now.

If anyone has any more info about DRONK, maybee the net would appreciate it.

>to deter some kids from smoking cigarettes (they talked over the transceiver
>to scare the kids).

Re the first part:

Are you thinking perhaps of The Hardy Boys book, THE SHORTWAVE MYSTERY? Those books have a character named Chet Morton. None of the rest of the description matches, however. In SHORTWAVE MYSTERY, I think that the Hardy Boys and Chet are already hams. They hear a call for help on their receiver which sends them of to Northern Canada for some reason which I can't remember.

Re Carl and Jerry:

I always loved those stories. I have two favorites:

1) They were tied up in a gas station by a baddie who wanted to kill the judge who sentenced him to jail (he happened to know said judge was coming to the station to get his car worked on). The phone was ripped out, but our heros managed to connect the speaker of a TV to the phone lines, dial by pulsing the wires, and got help.

2) They had some sort of bet about walking across a football field in a straight line. They found an underground conduit running across the field, hooked a little carrier-current xmitter to the power line, and managed to follow the conduit using a concealed receiver and antenna on the walkers foot.

Wow...lots more are coming back, but I won't bore you with them now. Thanks for reminding me of those great stories!

Now how about Mac's Electronics Shop in Electronics World: "Barney, knowing that he could take a break to listen to Mac's story, pretended to be interested ..."

Oh boy! You will be getting every possible response to this
question, most of them religious in nature. Just beware of any
that make reference to something called "Net Policy," as these
will be science fiction.

Since I haven't seen any description of the Cactus system yet, I thought I'd tell y'all what I know about it.

The Cactus Intertie is a consortium of individuals and groups in California, Arizona, and New Mexico, who operate a large network of 440-MHz linked repeaters. Each site has a controller that is actuated by TouchTones [TM] and can be addressed from anywhere in the system.

The system has a linear topology, which stretches from central California (near Sacramento, I believe) through about 14 stations, to El Paso.

Each station has local access through a repeater (usually 440 MHz), and many stations have remote bases, most of which are 2 meters and some of which have remotely controllable beam antennas.

The effort and expense of building and maintaining the network have been so immense that participation is limited to those who can put up substantial time and funds; it follows that they generally run the local access channels in closed mode (i.e., CTCSS). I have not heard any evidence of the pugnacious attitude attributed to the other California system mentioned.

A friend of mine here in Austin helped to duplicate this system while living in Florida (The 'Gator' interconnect system) and is now spearheading similar efforts here in Texas (The 'Armadillo' interconnect system).

  My suggestion is one of the neon optoisolators on the market. Just
hook one end to the phone line and the other one to a 741 op amp. Or,
taping an NE-2 bulb to a CDS cell will probably work, although I wouldn't
bet on reliability. I know that HP makes some neon optoisolators, but
you can probably get them cheaper...

   Several years ago, when I was living on Staten Island, N.Y., I used
the rain gutter as an antenna. I ran a piece of #22 wire under the weather-
stripping of my window to a sheet metal screw on the downspout.
   I loaded it up through my Dentron Super Tuner, and it worked rather well
on 80 meter CW with minimal TVI. My only problem with it was one day and it
was raining very lightly; Moisture on the downspout and a nearby, grounded
metal rod formed a 'capacitor' which blew up (very loudly) when I hit the thing
with 100 watts. An excitable neighbor saw it happen (sparks and all) and
notified management. Naturally I disconnected the thing before anybody could
get there to inspect the thing......

  Any traffic handlers out there? Catch me on EPAEPTN (3.917, 6 P.M. EST)

                                        --Jeff N2BSS

The novels are:
"CQ ghost ship"
"SOS at midnight"
"DX brings danger"
all are by Walker A. Tompkins (K6ATX)
The hero is Tommy Rockford. There has been a fourth one recently
released according to an ad I just received.
The books are available from Ham Radio Magazine whose address I don't have
handy.
They are accurate (as reasonably as the stories allow) in their depiction
of ham radio. And are written for a young audience. Jr. High or early
H.S. probably is the best age group.   One of the books was made into a
TV movie, I believe, but I don't remember which one.

>   every ring burst.
>   I would like to have as much isolation from the drop as possible
>   and have been considering optoisolators to connect the logic to
>   the line.

    A simple ring detector can be made from a GE H11AA1 optoisolator, which is a dual LED device which detects AC. Connect the LED input in series with a 3.9 K resistor and a 0.68 uF capacitor, and then across tip and ring of the telephone line. The optoisolator output is a transistor; overall sensitivity can be varied by using a resistor between the base and emitter. Some integration should also be done to minimize dialing transients from being detected; this can be done with a capacitor across the base and emitter. For CMOS use, the emitter can be at Vss to sink a logic input using the collector.

Summary: Similar case in NY State

In article <790@ihu1h.UUCP>, parnass@ihu1h.UUCP (Bob Parnass, AJ9S) writes:
> From the March 11, 1986 issue of the New York Times:
> Cordless Phones Raise
> An Eavesdropping Issue
> "TRENTON, March 10 - Cordless telephones are at the cen-
> ter of a debate in the New Jersey Division of Criminal
> Justice over whether current wiretap laws apply to the
> interception of conversations pulled out of the air."
> ...

There was a similar case in Olcott, NY (40 miles NE of Buffalo), about two years ago. It involved two neighbors who were feuding, one of whom was tape recording the cordless telephone calls of the other. A properly executed search warrant resulted in seizing the tapes and recording equipment, and a prosecution was commenced under the eavesdropping statues of the NY State Penal Law. After much todo, a trial by judge resulted in acquittal on all criminal charges.

While the judge plainly stated that he felt the eavesdropping was a "rotten thing to do", he could find no criminal violation of the NY State Penal Law.

The general legal reasoning behind the decision involved:

(1) The user of a cordless telephone operating on citizen's band frequencies has no reasonable expectation of privacy.

(2) The eavesdropping did not involve any physical act with respect to the "victim's" telephone line or premises.

(3) The eavesdropping consisted merely of using a radio receiver and tape recorder, with those acts in themselves not being criminal. The issue of "disclosure" to third parties of the communications was raised, but since such an act could POSSIBLY be a violation of the federal Communications Act of 1934 law, and the matter being tried was for the state law only, there could be no consideration of this issue.

The following blurb is from a description of the "Media Network" program (a program about radio and communications) that will be broadcast on Radio Nederland the first week in April. This description is copied from the April issue of "International Radio" magazine.

"India -- Video or Radio? Shortwave broadcasters know that India is a completely different market than other places in Asia. The audience is responsive and used to tuning the shortwave dial. Each year, one company, called PEICO, sells nearly 13 million radios. Still, we have received letters from listeners asking why the Indian receivers seem to lack the finish and technology of sets found in other parts of Asia, such as Singapore and Hong Kong. We talk to Philips for their reply. And can the Indian market expect PLL [Phase Lock Loop -WM] technology of new shortwave receivers soon? How much of a threat is the growing interest and importance of television? We also hear the views of some of our Indian listeners."

This program can be heard in North America during local Thursday evenings. The prime broadcast times are at 8:50 PM Central Standard Time on Thursday (which equates to 0230 GMT Friday) on 6165 and 9590 kHz, and repeated at 11:50 PM Central Standard Time (0550 GMT Friday) on 6165 and 9715 kHz. "Media Network" is a weekly feature program about radio and communications-related matters. I noticed this since I have long wondered about the Indian consumer electronic industry (something we never hear about in the US), and I thought that net.nlang.india readers that have shortwave radios might be interested in this broadcast. Since I was posting it anyway, I figured that net.ham-radio should get a copy on general principles... :-)

Ooops! I just re-read that posting, and realized that, though I referred
to "the first week in April", I did not give a specific date! That
particular Media Network broadcast is scheduled for Thursday, April 3
(in the US -- that is Friday, April 4 in GMT terms). Sorry about that!

Will

********** SALE **********

XEROX 820 single board computer for sale

Features:

- Z80 CPU
- 64K dynamic RAM
- Parallel ASCII keyboard interface (8 bits of parallel data and a key-pressed strobe)
- Floppy disk controller to interface with two Shugart 8" drives or two 5-1/4" drives
- Two independent RS-232 ports
- Real time clock
- 80 X 24 CRT dispaly (5X7 dot matrix) controller for use with an external video monitor (as a console output)
- System monitor (4K) with drive routines for CRT display, keyboard i/o, floppy disk control, and a reasonable command set

Price: US$80.00

Hello,

My name is Andrew Wylie and I have the unusual hobby of collecting
information about, and specimens of, the very earliest semiconductor
devices, both transistors and diodes.
    This is an area of industrial archaeology which seems to have been
neglected, possibly because 1954 does not seem so long ago. However,
progress in the field has been very rapid (as we all know), with the
result of rapid obsolescence of many devices. Most early transistor
equipment was junked long ago, and so early transistor types are very
hard to find indeed.
    Why should anyone care about this ? Well, the history of semiconductors
is interesting, especially because of the truly enormous changes to
society which have resulted from the development of electronics. In

addition, in my opinion at least, the early devices are really wierd and wonderful. Modern type with standardized packaging and numbering are absolutely boring, but some of the early types have to be seen to be believed.
    I have quite a large collection of early European types already, but am still very keen to obtain

- point-contact transistors
- tetrode or other unorthodox transistor types
- early American material.

I will pay postage costs, and also a nominal price which depends on rarity. (You wont get rich this way). I would be very glad to hear (via e-mail or normal mail) from anyone who has early material to offer, and also from anyone who has an interest in the subject. I can supply a detailed "wanted list" to anyone who requests it.

Why Can't My Scanner Scan Faster?

Bob Parnass, AJ9S

Scanner enthusiasts have tried to modify their radios to scan and search faster. Some modifications are successful, while others produce undesirable side effects.

Factors That Limit Scan Rate

There are limits to how fast radios can change frequency (scan or search) and still perform well without requiring modification of squelch circuitry. Most AM/FM scanners use the logic level output from a squelch circuit to determine whether a signal is present or absent. This signal is used for the purpose of stopping, or interrupting the scan operation. The ability of the common squelch circuit to detect the presence of a signal is dependent on at least 2 factors:

1. the strength of the signal

2. the duration of the signal

The first factor may be obvious to most readers, and is often specified as the "squelch sensitivity". It is the second factor that is important to our discussion. If a signal is present only for an instant, the squelch may not detect it, even if the signal is strong. In general, the faster the scan rate, the less time the squelch circuit has to detect the signal, and the stronger it must be in order to stop the scan.

In practical terms, the squelch circuit time constant imposes a limit on how fast a given radio can scan and still be able to stop on signals of weak or moderate strength.

Another limit is imposed by phase lock loop synthesizer circuits, which require time to "lock up" on a frequency.

Circuits That Determine Scan Rate

Most crystal controlled scanners contain a simple oscillator (also referred to as a "clock") whose sole function is to force the radio to switch frequencies. Speeding up the scan rate in this type of scanner is easy, usually just a matter of changing a resistor or capacitor in the clock circuit.

Modern programmable scanners employ microprocessors to control scanning, as well as other functions, like key-board decoding, frequency limits checking, timing scan delay, priority channel sampling, etc. The scan rate in these sophisticated scanners is determined within the microprocessor firmware.

Well intentioned hobbyists have attempted to speed up these programmable radios by altering the speed at which the microprocessor executes its internal instruc-tions. Not only does this increase the scan rate, but it can have several undesirable effects, like causing loss of memory, increasing the power consumption and temperature of the microprocessor chip, etc.

The Electronic Communications Privacy Act of 1986, which has passed the
House, now is a bill in the Senate (S.2575). This one Act affects every
usenet, bitnet, bbs, shortwave listener, TV viewer, etc. So that you
can see what is being proposed, I have keyed it in fairly quickly.
There may be some errors, so please do NOT consider this as the
official bill.

Send email to me if you REALLY want me to send you a copy of this 60K
file. If I get enough requests, it might end up being posted to some
newsgroup, but it is huge!

If you want your own official copy, send your request to:
  Senate Document Room
  Hart Senate Office Building, B 004
  Washington, D.C. 20510-7016

Many people probably missed lll-crg!well!tenney's offer to email a copy of
the Electronic Communications Privacy Act.

Listen up! This is no joke!

It appears to put legal liability on Usenet hosts which forward mail or
news for other hosts, and could alter or destroy the current structure
of Usenet (and/or Stargate). It was written by people who DON'T UNDERSTAND
EMAIL and networking, and was lobbied for by the commercial email companies
(telemail, compuserve, etc).

Read <1632@well.UUCP> (vnews/readnews users type 'p').
Post discussion to net.mail (keep it out of the other groups).

This bill, S.2575, is now pending in the Senate Judiciary Committee. It
purports to extend constitutional protection against unreasonable
search to electronic storage. However, it also does many other
things. It loosens the existing wiretap authorization laws and also

allows wiretaps and "tracking devices" (bugs) to be placed on people
for up to 48 hours without a court order. It also makes it illegal to
tune in cellular phone calls on your TV (channels 80-83). And it makes
you legally responsible for the carriage of email unless you run a "public
access" system.

Note that the current version of the bill (introduced last week with
no debate) may be better or worse than the above; my copy has not arrived
yet.

To get an up to date, official copy of the bill, contact the staff
below. If you object to it, tell them why, and tell them that you want
action on the bill delayed for further review (e.g. until your views
can be heard in written comments). Tell your home state Senators and
Congressmen the same thing.

Congressional staff:
     Ann Harkin, John Podesta   202 224 4242
     Steve Metalitz, Ken Mannella   202 224 5617
     Judiciary Committee   202 224 5225
ACLU:
     Jerry Berman, technology/privacy 202 544 1681

Hit them now on it, before they get back to session and try to pass it!

(What is a line eater?)

Due to the overwhelming response, I have posted the complete text of
the Electronic Communications Privacy Act in net.sources. Although
there have been some changes 12 August 1986, I think everyone should
try to wade through it (until someone posts a good summary) since it
could affect ALL of us. Be careful, because just reading it you might
think "Wow, this is good for us". You'll have to read it again more
carefully to see that the text EXPLICITLY makes it illegal to receive
scrambled or encrypted signals, or signals carried on a subcarrier, EVEN
IF it is otherwise readily accessible to the general public --- eg.
VideoText or closed captioning!!!!!!

     First, I would like to thank Glenn for keying in the original
Senate Bill 2575. I recently received a copy of the changes made
on August 12th and have merged them into the original posted by Glenn.
The uuencoded, compressed, context difference file of these changes
have been posted to net.sources. The only major changes have to do
with video and satellite transmissions. It looks like HBO, Showtime,
etc. have gotten involved in lobbying on this legislation. Also,
Captain Midnight? would be in real trouble if he interferred with HBO's
signal again. (Grep for video and also look at the very end.)

> in step with the protection you can expect to actually have if someone
> tries to break the law anyway.

I believe that law should generally follow reality. Throwing a signal
into the airwaves is equivalent to painting it on a wall. Anybody can
come by and look at it (in reality) and some of them might be able to
make some sense of it. If your business requires painting private
information on public walls, you'd better be *sure* your encryption is
good. A law that says "any old encryption will do" does NOT encourage
vendors to provide systems with real security -- if somebody breaks it,
and they find out, they can always tie the guy up with lawyers. On the
other hand, having no legal protection for any radio signals (e.g. if
you can decrypt it, it's yours) provides a STRONG incentive for vendors
to provide real, live, secure, working encryption. If somebody breaks
the encryption, their data becomes public and they have to invent a new
scheme, which costs money. Better for them to do it right the first time.

Reminds me of the old gun control motto: If decryption is outlawed,
only outlaws will have your data. (If decryption was legal, NOBODY
would have your data, assuming you do it right.)

Protecting "encrypted" signals would make it illegal to receive a
radio transmission that had been run through "rot13"...

It seems appropriate that I read this announcement in net.crypt.
Pardon the volume, but PLEASE DO NOT POST COMPRESSED AND UUENCODED
TEXT. First, doing uuencode causes a 4/3 expansion, so you've
already thrown away most of the advantage of compress. Second,
most sites already compress all news before sending it over a phone
line. Compressing text twice often leads to EXPANSION. Third, many
sites on the net don't have uuencode/decode, though public-domain
versions are available. These people will all post articles to
net.sources (the wrong group) asking for uuencode. Fourth, it
prevents people from using their favorite news interface to read
the text. Fifth, a lot of new users will write and post asking
"what's this gibberish? what's uuencode? what's compress?" Several
already have.

uuencode should only be used for binary files.

I don't intend to flame anyone because the intention was good. But
it increases, rather than decreases, phone costs. If on the other

hand, you read this and still do it, I hope you have an asbestos
suit.

Followups have been directed to net.sources.d. Sorry for the wide
distribution, but I was afraid I'd miss someone who'd do the same
thing again when the bill is revised.

I've had a look through the updated version of the Senate bill, and have a couple comments. I am not an attorney or legislator, and I do not have a copy of Title 18 to amend, so these may not be very informed observations:

First, I was surprised at how mild much of the bill appears to be, considering the cries of outrage that accompanied its posting. It's got some stupidity (I'll get to that), but much of the bill seems to be directed at updating existing communications and wiretapping law to reflect the existence of electronic media. Most of its poor ideas seem to stem from ignorance rather than real malicious intent.

I see two serious difficulties with the bill. First, and of most concern to usenet and BBS operators, is the complete failure to recognize the distinction between public, ad hoc, voluntary message services such as usenet, and for-profit electronic mail carriers. It has been pointed out already that the legal burdens placed upon a usenet site to maintain the privacy and security of communications is onerous. The bill may open a site operator up to criminal and civil action in the case that some user feels he has been damaged; you would have to consult an attorney to be sure.

More interesting to me is that a government agency can obtain an order requiring you to make copies of all mail coming through your site to a particular individual. Since, to my knowledge, software to do this is not commonly available, this may entail substantial expense, for which you may or may not be able to be reimbursed.

The second problem is, of course, the bill's simplemindedness with regard to radio technology. While seeming to exclude from penalties the interception of clear channel communications in the land mobile services, it then forbids interception of clear channel transmissions by common carriers. Excuse me, but doesn't that mean almost everyone in the commercial communications business? In addition, such things

as the interception of data on subcarriers is forbidden! Thus, if you have an SCA decoder, which anyone with $6.95, a Radio Shack, and a copy of Popular Electronics can build, you are a criminal if you intercept, for example, a reading service for the blind. I think it may also be illegal to pick up closed captioning without some sort of authorization, but it's not entirely clear.

   By the way, there is some fascinating language forbidding interception of signals "transmitted using modulation techniques whose essential parameters have been withheld from the public with the intention of preserving the privacy of such communication". Hmmm. To my knowledge, the owners of patents on such techniques (clearly they mean video scrambling here) have, by filing such patents, made such modulation techniques accessible to the public; they have not "withheld" them. Also, the bill does not specify who must have done the withholding, or what constitutes an "essential parameter". Barring a stupid judge (oh well), is this enforceable?

   Anyway, this is just an amateur analysis, but I though it might stimulate some discussion which, aside from the hand-wringing, has been absent. Also, some of these points (please check with someone more legally adept than myself), might form the focus of a letter to a senator. I think the point about reading services on SCA subcarriers and closed captioning might get someone's attention, whether or not they're bogus.

Dan Frank

Q: What's the difference between an Apple MacIntosh and an Etch-A-Sketch?

A: You don't have to shake the Mac to clear the screen.

Subject: Do you own a PAL video recorder ?
Newsgroups: att.general,att.ham-radio,att.wanted,btl.general
Distribution: nj

   I own a betamax PAL video recorder. I also have a large number of
PAL tapes that need editing, for which you need two VTR's.

   If you live sufficiently close to me and you are willing, I would
like to borrow your PAL recorder for a weekend to do the editing.
I will reciprocate in kind (i.e. you can borrow my PAL recorder for
a weekend to do your editing).

   Thank you,
         Giovanni Vannucci
         AT&T Bell Laboratories   HOH R-207
         Holmdel, NJ 07733
         hou2e!gv

 P.S. for readers who are wondering what PAL is, it is the color
television system in use in a good part of western Europe. It is
incompatible with the NTSC system in use in the USA, so that a
video recorder purchased in the US cannot play tapes recorded in
Europe.

The quote you provided doesn't say anything about the techniques, it
says parameters. Thus, if a signal has been encrypted, the "essential
parameters" refers to the decryption key, which is normally withheld
from the public, even though the encryption device has been patented.

On the other hand, maybe they aren't talking about patented scrambling
techniques, but are saying that broadcasters must use proprietary
scrambling devices in order to be protected.

First reaction

Perhaps the strongest impression on seeing the text of the privacy act is how incredibly draconian the penalties are considering the ease with which radio communications can be intercepted and the fact that such interception isn't currently a crime.

The crimes

The act provides that intentionally intercepting the contents of a radio or electromagnetic communication "not readily available to the general public" is legally the same crime as wiretapping or bugging and carries the same penalties with certain few exceptions.

The bill provides a year in jail and/or a $10,000 fine for merely intentionally listening to ("acquiring the contents of") a radio communication on certain frequencies (those used by radio and TV remote pickup and studio transmitter links), sent over facilities provided by a common carrier (such as a communications satellite) or on a subcarrier or other subsidiary signal (such as Teletext, vertical blanking interval signals + SCA). This 'reduced' penalty only applies if the interception is not for commercial purposes or private gain or in violation of any contract and is the first offense.

The full penalty of five years in jail and a $250,000 fine applies if the interception is for commercial purposes or private gain or is a second or subsequent offense.

And perhaps the most incredible of all - five years in jail and a $250,000 fine for intercepting and acquiring the contents of (ie descrambling) any radio communication that is "scrambled or encrypted" (such as pay tv stations or scrambled satellite TV). This applies even if this is a first offense, and is not for private gain or commercial purposes. There is no requirement that the scrambling or encryption be secure or difficult to break, absolutely any kind qualifies.

And in a very nasty section, not only is it a crime for which one can get thrown in the pokey for a year to intercept a common-carrier signal or other private signals but it is a crime to intercept any signal whose "essential modulation parameters have been witheld from the general public" in order to protect privacy. This means that if one finds an odd signal and demodulates it, one may have committed a serious crime

even if one had no knowlage that the signal was modulated that way for the purpose of preserving privacy and knew (from the frequency or other information) that it was not a common carrier signal or other otherwise private signal.

Further the bill provides for civil damages for anyone whose radio communication, "not readily accessible to the general public", is intercepted or used. This provision allows for a suite to recover all profits or gains from the use of the communication, court costs, and punitive damages of the greater of $10,000 or $100 a day for every day the radio communication was intercepted. Though I am not a lawyer (just a humble engineer) it appears to me to be possible to mount such a law suite even if there was no criminal prosecution for the violation. (That is to say if the local pay TV or cable company (this applies to wire communications too) decides to take you to court for descrambling their pay signals they can do so and collect $10,000 damages even if the local US attorney doesn't want to prosecute you on the felony interception charges.)

The exceptions

There are bizzare exceptions made for cellular telephone calls (6 months and $500) and non-scrambled or encrypted private satellite video (only $500 !!), and complete exemptions for cordless telephones and tone only pagers (???!!!).

The things that are legal

Certain things are explicitly legal to receive including anything on ham, CB, and general mobile radio service frequencies, a distress signal from an aircraft, vessel or person (not car or truck), transmissions from a marine or aeronautical communication system, and police, fire, civil defense, government, and law enforcement transmissions that are readily accessible to the general public.

Naturally one can legally receive any transmission specifically intended for the general public such as radio and TV broadcasts (but not any subcarriers or subsidiary services riding on broadcast signals unless they are also specifically intended for the use of the general public). And one can legally receive unscrambled and unencrypted satellite transmissions of programs intended to be broadcast (network TV feeds and radio feeds). I believe that the underlying law already allows reception of cable tv feeds (Satellite Viewing Rights Act) that are not scrambled or encrypted under certain conditions.

An editorial note

To me, the radio part of the Electronic Communications Privacy Act seems to have little or nothing to do with privacy of radio communications. It seems to really be a bill designed to protect the economic interests of certain people who transmit pay tv signals, stock market data, cable TV programming and other signals that have recently become targets of widespread piracy. Unfortunately,

the way the law is written it makes no difference whether or not there is an intent to steal a service, it is a felony to merely peek to see what is there.

If there is an intent to protect privacy, it is not to mandate real security or provide encouragements to carriers to provide it, (the bill carefully avoids making carriers liable for the disclosure of radio communications transmitted over radio systems foolishly designed so they can be easily intercepted (like cellular telephones)) but to make sure that it is in fact a crime to intercept almost any conceivably private communication. The actual purpose of this is more to get providers of communications services off the hook if customers sue them because their communications were intercepted then to provide security as it is normally a valid defense against charges of negligence to demonstrate that the act in question is a serious crime.

The saddest part is that the bill does nothing to encourage the use of the only technology that can provide real radio security - encryption with a secure cipher. It actually stifles that effort by giving complete legal protection to any cipher or other security technique no matter how feeble, and by protecting even many completely open signals with harsh penalties.

Post Script

The rest of the act is basicly anti-hacker. I am on the side of the angels on most of the rest of the bill's provisions, as I do think that there is a fundemental difference between listening to a radio communication and breaking into a computer system and accessing private information contained therein (or exceeding ones authorization to use the system). Radio is all around us, and is by its very nature a publicly accessible medium - while wire (fiber and cable) communications and computer systems are legitimately private spaces.

Some sleepers in the bill - very technical

The most obvious sleeper is the use of the key (and very ambiguous) phrase "readily accessible to the general public". Though the bill defines that concept as it pertains to radio (and thus precludes use of the extremely logical and common sense argument that almost any radio signal is readily accessible to the general public), the phrase is made for judges to add interpretations to.

Almost any signal which is on a secret frequency, or has not been widely publicized, or seems from its contents like it ought to be secret, or is not publically admitted to by its owning agency, or which requires special equipment to receive could be excluded on the grounds it wasn't readily accessible to the general public. I am sure that the argument will soon be made that any signal on a non-published or secret frequency is not readily accessible to the general public just by virtue of the fact that the frequency information is not made readily available to the general public.

Ready Access

The bill leaves hanging questions about signals that are only receivable in certain limited places (such as highly directional signals, very low power signals, or signals on frequencies that don't propagate well) Is it illegal to receive them even if one happens to live near the transmitter ? Suppose one builds a large antenna ? What sort of difficulty does one have to go to to exceed the limits of "ready access" ? And what is the "general public" in this context anyway ? Does being a technically knowlageable engineer or other specialist disqualify one from membership in the "general public" the bill refers to ?

Banned Frequencies

The bill for the first time forbids receiving and "acquiring the contents of" any communication on certain frequencies allocated to broadcast remote pickup and auxiliary services regardless of whether the intercepted signal is in fact a signal used by a broadcast station. This concept of a "banned frequency" might prevent one from receiving ANY radio signal of unknown origen on some frequencies if the bill is strictly interpreted. In many ways that is a much harsher restriction than forbidding the "acquistion of the contents of" a signal transmitted by certain specific groups.

This establishes a nasty precedent that might have impact on electronic instrumentation, EMC/Tempest, and rf equipment engineering, test, and repair. It also could be used to convict someone for simply possessing a receiver turned on and tuned to such a channel since it could be argued that receiving any signal that came in (presumably including cosmic noise and the thermal background hiss) was illegal unless one could establish that one was an authorized recipient of some lawful transmission on these channels. And it would make establishing intent easier, since there could be no legal purpose for someone not authorized to receive such signals to possess a receiver for those frequencies.

Common Carriers

The bill defines as private any signals "transmitted over a communication system provided by a common carrier". This would seem to include situations where the common carrier provides radios, transmitter sites or other facilities to radio communications systems that do not operate on common carrier frequencies. This makes determining whether a particular communication is private and illegal to listen to much more complicated. (An example is the White House Nationwide (Echo Foxtrot) radio system used to provide a very unsecure radio telephone connection to Air Force One - this system is supposed to have been provided by AT&T in whole or in part and uses AT&T sites but uses federal frequencies for the radio links)

It is also very unclear what the bill means by "transmitted over". Does this mean transmitted by a transmitter provided by a common carrier ? Or does it mean that if the signal at some point in its path between original sender and ultimate recipiant goes over a communication link provided

by a common carrier it is illegal to receive it ? Suppose it is transmitted by a privately provided transmitter in communication with a common carrier system (such as a cellular phone owned by a subscriber and not purchased from a common carrier) ?. How about an otherwise legal-to-receive radio signal that happened to go over telephone lines or other common-carrier provided facilities between the control point and the transmitter (a very common case in mobile radio systems) ? How about signals from a privately owned satellite uplink ?

Subcarriers

Another bit of legal language that could be sticky is "subcarrier or other signal subsidiary to a radio transmission". At first glance this seems to mean SCA signals on FM radio broadcasts. But depending on how subcarrier is interpreted it could mean virtually any modulation more complex than simple direct AM or FM. Is a FDM-SSB voice channel a subcarrier ? (One could argue no, it is not further modulated - it is merely shifted in frequency - unlike an FM subcarrier which is itself a modulated carrier.) Is a pcm subchannel on a tdm multiplexed signal a subcarrier ? What is meant by "subsidiary to" ?

Many digital signals transmitted over analog paths (such as the AFSK used in 2 meter ham packet radio) use modems which modulate an audio frequency carrier. When transmitted over a radio channel, these audio signals become subcarriers. Does the bill mean to preclude reception of any digital transmission except direct FSK, PSK or PAM of a carrier ? (Reception of 2 meter packet is otherwise explicitly allowed so this is not an issue for hams). What about those military multiplex HF RTTY transmissions that some people copy news wires or weather information from ? Are the individual channels subcarriers or separate 85hz shift FSK signals that happen to be transmitted from a common transmitter ?

Scrambling

Another problem area lies with the definition of "scrambled". To lawmakers this probably means what one sees on a pay cable channel one doesn't subscribe to. But what constitutes scrambling ? What parameters of a signal have to be changed for it to be scrambled ? Is merely inverting the usual video polarity (as some satellite services do) scrambling ? What is enough alteration to put one in jail ?

And what constitutes scrambling for other sorts of radio signals ? Does it have to be effective ? or is it merely enough to alter some parameter of the signal with the intent of making harder to receive on some kind of receiver. Suppose your receiver can receive the signal anyway, is it still illegal ?

Another problem with the term "scrambling" is that it has a technical meaning different from its common usage meaning. All modern digital radio transmission systems (and almost all modems > 300 bps) permutate the data transmitted with a digital pattern to ensure that the modulated signal contains plenty of 0-1 and 1-0 transitions (for maintaining clock

synchronism between transmitter and receiver) and to guarantee that the same data does not always result in the same modulated signal in case some particular pattern in the data produces a worse case analog signal (this ensures that if the transmission is retried, it probably will work the second time). This technique has been called (since its inception) "scrambling". If it is illegal to intercept a radio signal that has been scrambled for this purpose (and the bill does not say "scrambled or encrypted to protect the privacy of" it will be illegal to intercept almost any properly designed digital radio transmission or radio transmission of a modem signal carrying data at greater than 300 bps (except 202 FSK).

Note to Phil Karn

I don't have my table of FCC frequency allocations handy but isn't 39.17 mhz (the frequency on which the preacher hears God) a broadcast remote pickup frequency ? Perhaps Phil Karn's theory that the fundementalists are the force behind this bill because of the debunking of that phoney TV evangelist on the Johnny Carson show is real !!

Sigh. Once again we see an example of an incredibly stupid law
being proposed. Is there any chance that this monstrosity will
pass?

Rather than fine someone for intercepting signals, they should
fine the sender for being too stupid to use a secure encryption
scheme and reward the "pirate" for revealing the insecurity in
the system.

If we can't keep our systems secure from our budding hackers, what
are we going to do when the Soviets decide to disrupt our communications
prior to launching a first strike? I say we owe the hackers our deepest
gratitude for revealing our stupidity before it is too late.

> pass?
>

While I agree that the proposed law is a change in the way the airwaves have been treated in the U.S. (anyone can try to receive anything, only transmissions are regulated), restrictions on reception are common in many other countries. Despite the difficulty of enforcing restrictions on receptions, many governments have chosen to pursue this route in an attempt to protect themselves or major commercial interests.

There is more to restriction on reception proposals than merely seeking to protect commercial interests. If the responsibility for ensuring secure communications were lodged solely with the system operator, it would be quite reasonable for the operators to pursue the use of digital encryption. This is likely to lead to the introduction of some very nice encoding/decoding boxes to the general public. According the the government, the general public includes terrorists, subversives, common criminals (as opposed to uncommon criminals), and hackers (!). The law enforcement and intelligence agencies would not like these unsavory characters to gain ready access to a means of communication that could not easily be tapped. Some of the encryption schemes can not even be broken by the National Security Agency.

In an effort to avoid handing any more advantages to criminals (e.g., communications secure from monitoring by law enforcement people), the government has evidently decided to restrict selected public freedoms. We must decide which of the various conflicting rights take precedence in the arena of communications. It is not an easy decision to make.

This makes sense. However, it is contrary to a decision recently
made by the Federal govt, incouding the NSA. Federal contracts
have been let to three companies to build digitally encrypted telephones
for use over the regular switched public phone network.
Initially intended for Federal agents and companies with govt contracts,
these phone sets are expected to ultimately be sold to any US
citizen willing to pay (about $2000) for them.

The intent is to stop the Russians from monitoring our phone calls,
as alluded to earlier. The NSA has stated that it realizes that
the Mafia et al will surely take advantage of these phones to
thwart the FBI et al, but that this **is a price we are willing
to pay** to stop the hemmorhage of foreign and industrial
espionage currently occuring on our telephone system.

(On the other hand, there is the case of the college prof
who was told by the NSA not to divulge his great new encryption
technique, because the NSA didn't know how to break it.)

Do you get the idea the Feds' left and right hands don't know
what each other is doing?? Why am I surprised?? :-(

Criminalizing radio reception in the hopes that providers of communications services will not provide their customers with a truly secure service is only a short term solution that at most buys a few years. The basic technology of end to end secure telephony is here now, and is getting cheaper and cheaper every year. It will not be too many years before the cost is low enough so some enterprising folks will mass market secure telephones. (I have dreamed for years of doing this when I finally find myself and get rich). As for data communications, the technology for effectively encoding digital data has been around for years, and anyone with something to hide would have to be stupid not to use the available tools such as the plethora of RSA/DES encryption programs for the PC family.

It seems very likely if the federal government continues to follow it's current anti-privacy policy there will have to be a follow on act to the Electronic Communications Privacy Act making the possession or use of effective cryptographic technology illegal. In fact use of ciphers or codes over public communications facilities IS illegal in some countries. Simply relying on market forces to keep effective ciphers out of the public hands will not be enough.

Unfortunately, this policy of dangerous openness and harsh civil and legal penalties for exploiting it leaves most of our communications terribly vulnerable to any serious criminal or spy clever enough to quietly intercept and exploit them. There will be no certainty that someone (in addition to the NSA, FBI, CIA or other such friendly agencies with long histories of law abiding and ethical behavior) isn't listening. If the law is effectively enforced (with well-publicized arrests of comparatively innocent listeners and long jail terms) most casual radio hobbiests and technically clever hacker types will be careful of what they publically admit to doing; and sadly some of the more law-abiding sorts (myself included) will probably give up what was a very innocent and non-criminal hobby that helped sharpen and develop our technical talents. It is hardly clear, however, that this group of people constitutes much of a threat to anyone.

But the federal policy will be very much to the advantage of anyone who wishes to exploit communications and who is willing to take the risk of penalties under the law. A great deal of what might have been securely locked away beneath ciphers generated by $15 chips that produce keys only breakable with very large scale systems will be happily out there in the open for anyone with even simple equipment to intercept if they dare.

This brave new world will be a field day for pirates, common criminals, sleazy characters and spies. And even more so if the public is denied access to secure communications technology so they can't protect themselves even if they want to.

And I am particularly frightened of certain implications. The new law will only be effective in curbing the use of secure communications technology if it is enforced effectively enough so that users of communications systems are given the illusion that what they are sending is private by virtue of the stiff enforcement of the legal ban on interception. If the law is ignored as much as section 705 of the communications act has been (the current privacy provision) nobody with any sense will believe that it protects their privacy and there will continue to be public pressure for encryption. So the government will have to aggressively and publicaly prosecute listeners, and pressure judges into giving them harsh sentences. This necessarily implies that some innocent people are going to be badly hurt, and I am afraid that hams, SWLs and particularly the technically sophisticated engineering professionals who dabble as an innocent hobby in such projects as trying to break satellite scrambling schemes are going to be made examples of and thrown in jail.

Radio regulation enforcement has not been draconian to date, the idiot ("Captain Midnight") who abused his position as an uplink operator to jam HBO only got probation and a moderate fine. It is pretty hard to see judges handing out 5 year sentences and $250,000 fines for such passive acts as descrambling some Canadian satellite feed or a soft core pornographic movie. It is even harder to see a judge throwing the book at some poor fellow who buys a scanner and listens to a mobile phone conversation. And yet the only way the Privacy Act is going to be beleived is by very stiff sentences - if there aren't such sentences the public won't feel secure. It isn't even clear that the required police/FBI manpower, prosecuters, and cooperative judges will ever come together to give the act teeth (although it is quite possible that the authors of the bill expect the civil penalties with lesser standards of proof to be the main deterents).

In addition to stiff sentences for merely listening and further legislation forbidding use of secure ciphers, I think that the federal policy will not be seen as credible by the general public unless there are curbs on sales and possession of interception equipment. This no doubt means that such things as scanners, TVRO's, Hf-SSB receivers (connected to a TVRO a HF-SSB receiver can intercept a remarkable collection of private microwave and satellite communications), and other radio receiving devices will become illegal.

I had long suspected it: Encoded communications contain a certain "signature"
which makes them easy to identify in the MASS of communications. Either
it can be detected by the pure randomness of the bits, or, maybe, the crypto
device has a little "innocuous" commercial in the header of each message;
something like: "Safe communications - another service of <your favorite
3-letter company goes here>"

It is thus easy for the spook to identify the messages worth paying ATTention
to .... and, of course, having the decoder helps ...(-:

==========

The following is from the September 1986 issue of MONITORING TIMES (Published by Grove Enterprises, Inc. P.O. Box 98, Brasstown, North Carolina 28902).

This first item is excerpted from a letter by Robert Horvitz, Government Affairs Liason for The Association of North American Radio Clubs (ANARC) regarding the Communications Act:

ANARC has called for hearings to discuss the radio provisions of the bill and to examine alternatives. We've circulated a list of amendments that would alleviate most of our concerns. We support the general goal of the bill, but believe that privacy of wireless communications can best be assured through technology, not by making criminals out of law-abiding radio users.

Senate staffers acknowledge that our amendments have merit, and hearings might be useful, but they're not convinced that many people share our concerns. This is a political process, and SENATORS ARE NOT GETTING MUCH MAIL PROTESTING THE BILL'S TREATMENT OF RADIO.

YOUR SENATOR MUST HEAR FROM YOU.

CALL, TELEGRAPH, OR SEND A MAILGRAM to your Senator and the Members of the Senate Judiciary and Commerce Commitees as soon as you get this. Express your views. Ask for hearings and more time to assess the bill's consequences. Say whatever you think. But SAY IT NOW!

Otherwise, you could soon be exposed to Federal criminal and civil liabilities merely by using a scanner.

==========
(All emphasis in the above is the author's.)

The following is a sample letter to your Senators from the same issue of Monitoring Times; since they want this passed around to as many people as possible, they won't mind it being posted in its entirety here:

Senator----------
----------Office Building
Washington, D.C. 20510

Dear Senator----------:

I am writing to vigorously protest the passage of Senate Bill 2575, the Electronic Communications Privacy Act of 1986. As written, substantive portions of the bill are illogical; worse, they reflect considerable ignorance of the laws of physics and the realities of the consumer marketplace.

The mobile telephone industry has convinced Congress, and is now working on the Senate, that cellular mobile telephone calls are inherently private. They are not. As with other forms of mobile radio they are--and always have been--readily accessible to casual monitoring with widely manufactured consumer entertainment radios and even television sets.

In an apparent effort to boost a lagging marketing program, the cellular telephone industry's powerful Washington lobby is obviously attempting to legislate legitimacy to the invalid claim that cellular mobile telephones are inherently private.

At the present time there are, according to independent estimates, some 7 million scanners and 19 million shortwave radios capable of receiving frequencies which would be outlawed by the pending legislation. Many of these frequencies are assigned on a shared basis.

Clearly, it is not only impossible to avoid encountering them, it is necessary in order to determine their sources in cases of interference, frequency studies for license applications, and other legitimate needs of access to a public resource.

All other users of the radio spectrum are made aware that, by its very nature of penetration of private dwellings, radio signals may be monitored by anyone who wishes to tune them in. Only the mobile telephone industry expects a law to be granted in their interest to forbid Americans from fully utilizing pre-existing radio and television equipment manufactured under present law and purchased by them in good faith.

Inexpensive devices exist which can be added to any communications equipment to encrypt their transmissions, making casual interception impossible. The mobile telephone industry is well aware of this, but would sooner have the burden of non-interception placed on the American public rather than pay the minor up-front cost of adequately designing their own equipment.

Adequate law presently exists prohibiting the intrusion of uninvited listeners into private communications and the subsequent use of the information so obtained (the Communications Act of 1934, section 705 as recently amended); superseding this workable regulation with a bad law that is totally unenforceable and illogical in its basic tenets makes a mockery of the judicial system.

In conclusion, I am in favor of protecting the right of privacy of the individual when such a right has a reasonable expectation. I am

opposed to any legislation motivated entirely by corporate profit and which, by its self-serving interest, is unreasonable and unenforceable.

Please consider the testimony of so many well-informed individuals to bring correct perspective to the hearings on this subject in spite of the highly financed special interests' attempts to obscure the facts.

Sincerely,

==========

(End of sample letter. List of Senators, addresses and Washington phone numbers follows. Much thanks to Chris Tucker of North Kingstown, Rhode Island, for having the patience to type this into his Commodore.)

==========

The following is from an editorial by Bob Grove in the above-mentioned issue of Monitoring Times. He raises an interesting point concerning Government priorities when it comes to the 'electronic privacy' of American citizens:

In spite of vigorous protests by National Security Agency, Central Intelligence Agency, and the Federal Bureau of Investigation, 350-foot high Mount Alto in Washington, D.C., was turned over to the Soviets for their construction of an elaborate radio interception installation aimed at the White House and other prime sensitive targets in the nations's capitol.

Another question of mental competence arose when high ground was given to the Soviets for a similar facility erected as a 19 story building in Riverdale (The Bronx), New York.

==========

Mind you, being diplomats, the Soviets in D.C. and The Bronx are protected from persecution under diplomatic immunity.

Two common integrated circuits were demonstrated before a House committee that would easily provide a very secure level of encryption. One IC cost $2.00, and the other cost $20.00. "Far too costly"? Who is the cellular phone industry trying to fool? This Act would prohibit the "interception of signals not usually accessible by the general public." To wit, the 800 MHz portion of the electromagnetic spectrum used by cellular phones (also used by channels 80 through 83 on the UHF dial). What really gets

me is that the ACLU is pushing the bill because they don't want police to be able to intercept private phone calls or some such nonsense. Unless the police are really after someone, they are not going to go chasing a low-level signal around a city to prosecute someone; phone tapping is much easier. And unless cellular phone calls are encrypted, they will not be secure, period. I would never think of purchasing a cellular phone knowing this; if I am going to buy a $2,000 phone, I want a $20 chip in it that will really guarantee me a secure circuit. (I don't remember what the chips were--anyone know?)

The Justice Department has already stated that it will not enforce this Act should it become law--how would they be able to? Someone would have to do something really blatant to be prosecuted. The way to secure information that the public has ready access to (and let's face it, anybody can tune a TV in to channels 80 through 83) is to encrypt it, not to tell people they can't monitor certain channels and expect them not to.

I have a ten year-old HRO receiver that tunes from DC to 30 MHz; since HRO is a well-known name in amateur radio, I doubt that I am the only person with one. I have built several block converters that work quite well with this radio, extending its tuning range in to the UHF band. This is not to mention equipment from Regency. If, in turning dials, I come across a conversation on a "secure" frequency, I would be breaking the law. If any transmission is too sensitive for the general public, then it should be secured by encryption; it's cheap enough now, and building receiving equipment is just too easy.

--Paul Mazzarelli

The low-cost secure voice terminals (STU-III) contracted for by NSA via
ATT, Motorola, RCA et al. will not pose a problem for NSA. Who do you
suppose will manage the keys for the new secure phones?

Unfortunately, given the porosity of NSA, one can expect the ultimate
result will be a substantial net loss for true security of U.S. interests:
bureaucrats will spend billions and will become assured of the security of
the techno-glossy new system- *everyone* will be required to use it,
with the greatest urgency of use reserved for the most truly valuable
info. Ivan will pay a GTE clerk enough to cover his short positions on
the day the stock market falls 100 points and he'll hand over the key list.

It's happened before, according to my newspaper.

Er, in my smart aleck posting about the possible subversion of NSA-knows
best crypto schemes (I advocate autonomous key generators), make
that "on a day the market *rises* 100 points etc. etc."

Appropriate garbage for the line-eater.....

Pardon the posting to the net, but I have exhausted all my other known sources for this information. Perhaps the association with ARPANET will lead to success.

I am in need of operations/maintenance manuals and schematics for an older Telonic sweep generator which I purchased on the surplus market a year ago. This generator was a commercial unit which was purchased by the USAF. The commercial designation was Telonic SPI-64 and the USAF designation was SG-599/DRA-6. It was made by Telonic when they were still in Beech Grove (now known for Wavetek). Telonic says that their records are sketchy for the days before the move to sunny California and that they have no information on the unit. One engineer claimed to have worked on it in his early days, however. USAF informed me that this model was removed from service about ten years ago and that they had never purchased enough of them to issue a Federal manual - the manuals supplied with the units were all that they ever purchased. I have checked with companies who deal in used test equipment, military manual suppliers, etc. with no luck.

I would be very grateful to either buy or borrow a manual from anyone on the net. If either of these numbers rings a bell with you, however faint, please look through your bookcases, closets, storerooms or what have you to see if you might have the last remaining copy in existence. Restoring older pieces of test equipment for functional use is a hobby of mine (i.e. GR, HP, Tek, Collins, etc.) and this generator is too fine a piece to be relegated to the "junque heape." Thanks for your help. 73!

I think I have missed something in this discussion of communications privacy.
Has there been a proposal in Congress to ban transmission encryption, or is
that eventuality merely a supposition on the part of some net.crypt posters?

Summary: THEY'RE ABOUT TO MAKE IT THE LAW -- SEND TELEGRAMS NOW!

In article <228@dione.rice.EDU>, scorpion@titan.UUCP writes:
> What is the status of this dread bill?

Sad to say, the Senate Judiciary Committee passed the bill on to the full Senate. The Senate is trying madly to pass everything in sight before they recess, so there will be a lot of pressure to get it passed next week.

NOW IS THE TIME to pick up the phone and call Western Union. Tell them you want to send a telegram to your Congressmen. They have a special cheap rate for this. A list of all the Senators is at the bottom of this message. Identify the bill by name and/or number (S.2575), state that you are opposed, e.g.:

"I strongly oppose passage of S.2575, the Electronic Communicaions Privacy Act."

then give them a reason to believe you and a reason to delay or kill the bill. E.g.

"I have been using electronic mail for XX years and I believe this bill will make things worse than they are now. We will do better by creating our own security via encryption, rather than having the government step in."

"I have been a ham for XX years and I believe that the radio provisions provide an intolerable burden on citizens' rights in order to make life easier for a few companies, who should be using secure encryption."

"I believe this bill reduces civil liberties while claiming to increase them. Its definitions are sufficiently vague that I cannot determine what data in my computer system is protected by the bill or even if it applies to my system."

"The bill makes it illegal to intercept data 'not readily available to the general public' but this is not defined. I believe that any data that is transmitted through my house is readily available to me, but I'm sure the courts will not see it that way. Much of the bill hinges on the definition of what is public and until it is very clearly defined, the act is harmful and should not be passed."

"The act lightly reverses 50 years of doctrine around radio reception. I believe that this reversal is unsound. The proposed restrictions on public

ownership of radio receivers are a threat to liberty."

"My company builds equipment that comes under this law. I believe it would make it harder for our customers to communicate with each other due to the possible criminal and civil penalties it places on such communication."

"I believe this bill would allow a court to define my computer as a 'surreptitious interception device', since it can be used to decrypt encrypted material, and confiscate it. This is insane."

"I believe that reasonable and cheap means of encryption exist which could be employed by the cellular, satellite TV, and other industries, which would provide them true security rather than the legal sham security provided by the bill. The sham security comes at a cost in civil rights and in government interference in private life, which I feel is intolerable."

etc, etc, etc.

Here's a recent excerpt on the bill from Robert Horvitz (hoptoad!well!rh) who has been lobbying against the bill on Capitol Hill and reporting on it on the Well:

Item: 171 R 12 - ECPA Update Continued
Date: Wed, Sep 17, 1986 (18:01)
From: rh (Robert Horvitz)

> Continuing discussion with the drafters of the bill reveals that COMPUTERS may, under certain circumstances, qualify as "surreptitious interception" devices - if they are designed or configured for the specific purpose of decryption. Language spelling out what devices, or what capabilities, would be banned hasn't been adopted yet, but my understanding is that software does not in itself constitute a "device," so the ban would be primarily aimed at hardware, particularly dedicated hardware, as opposed to general purpose devices. The most likely outcome is that the bill will rushed into law without clarification on this point, and a court will have to decide what computers are legal to own, manufacture, etc.

Here is the list of Senators, copied from an earlier posting so it's right here and you have no excuse to not call now! Save a copy of this message and you can 'grep' for your 2-letter state abbreviation (eg. "CA").

(For follow-up, please read disclaimer at the bottom of this message first.)

tecNICA is an organization which provides technical expertise to the country of Nicaragua. Typically, a volunteer will pay her/his own airfare to Nicaragua, work for 2 weeks at a host agency in Managua and be given room and board by the agency at a residential inn (or hospedaje). Tours of the countryside are arranged for weekends and talks with officials and opposition leaders are often arranged for evenings. Computer specialists, mechanics, economists, agronomomists, telephone experts and other technicians have all made valuable contributions to the Nicaraguan government under the auspices of tecNICA. Current priority needs are:

Computer systems: UNIX, Kaypro, LANs, Monroe, Sharp SR80, Sanyo MBC550, TRS 80,

Tandy 1000
Computer programs: Condor, database design, Proplan, RATS, TSP, digital telex,
IBM DBMS, Lotus 123, Multiplan, Wordperfect
Engineers: hydrology, electronic composition, soil, telecommunications,
automotive, HVAC, mechanical, radio packet systems
Other: economics

If you have other technical skills, chances are, you could make a valuable contribution to Nicaraguan society. I worked as a computer programmer (for the Ministry of Health and for the telecommunications center) in Managua in the Spring of 1985 and not only found that I was greatly appreciated, but found the trip to be a great cross-cultural experience, kind of like a mini-Peace Corps.

If you have questions, you may address them to me or you may contact tecNICA itself by calling:

Berkeley -- (415)848-0292, 2727 College Ave., Berkeley, CA 94705
New York -- (212)427-0634
Boston -- (617)782-0510
Seattle -- (206)321-1367
Chicago -- (312)524-0198
Los Angeles (213)394-1183

tecNICA is in the process for applying for tax-free status, until then tax free contributions may be made out to: "tecNICA/Capp Street Foundation."

>I think I have missed something in this discussion of communications privacy.
>Has there been a proposal in Congress to ban transmission encryption, or is
>that eventuality merely a supposition on the part of some net.crypt posters?
>

There hasn't yet been such a bill, but as a number of posters have pointed out, apparently one of the major forces behind the movement to pass the Electronic Communications Privacy Act is a group of law enforcement and intelligence agencies who are reputed to fear that widespread use of secure and effective encryption will deny them important sources of intelligence. (eg terrorists, organised crime, drug dealers, hackers, and other such bad guys will start using secure crypto communications if they are made widely available)

It is assumed that the agencies are backing the bill because it provides legal protection for unencrypted common carrier communications, and for any other communication encrypted in any manner (or even transmitted using complex or unusual modulation). It is presumed that they feel that the existance of a strong law with stiff penalties and the possibility of civil as well as criminal action (with lower standards of proof and no prosecutorial discression) will be seen by the communications service buying public as an adaquate answer to the security problem, and the movement toward use of really effective encryption will slow down or stop as a result.

I personally suspect that the large common carriers (who have also backed the bill) would very much not like to spend billions of dollars securing their transmissions (particularly the wide open microwave radio and satellite links that represent the lowest-cost-to-provide long distance interconnections). If the bill passes the carriers will have a legal defense against lawsuits by subscribers whose communications have been intercepted from these links, if there isn't such a law someone might someday successfully sue a carrier for a large amount of money for not taking adaquate precautions to ensure his privacy. And a court ruling that the mostly open transmissions currently used are not adaquately secure could be devastating to carriers with limited investments in such more secure technologies as coaxial cable and optical fibers.

Thus the intelligence agencies are hoping that shielded

from liability for providing privacy the carriers will not
install encryption and provide secure service as rapidly since the major
reasons for them to do so (fear of lawsuits and public pressure) will have
been at least partially neutralized. And they hope that the
public, provided with a new and powerful defense against those
who intercept its communications (the civil penalties) will not
press as hard for technology that provides real security (even
from the intelligence agencies themselves).

     I speculate that this attempt to slow the spread of encryption
by providing legal tools to wronged parties and protection to carriers
from suits will not be enough to prevent its use from becoming widespread,
and that the intelligence agencies will have to pressure for restrictions
on the use of encryption. And perhaps there are fools enough in congress
for such a law to pass too..

I'm looking for a device that will perform Frequency Shift Keying
decoding, with input frequencies of 1500 Hz (mark) and 2300 Hz (space),
at a faily rapid rate (300 baud or better). Also, I would like to
find a device that will convert frequency to voltage, continuously,
over the same range.

I could sure use some help. Thanks, Steve Miller WA4LDA

I suggest you contact EXAR. They manufacture several IC's that are usefull building blocks in such circuits. i.e. FSK modulators, decoders, modem filters.... If you're around the 408 area code, I think their distributors are "Bell Industries" @408 734 8570. Also another company... Silicon Systems makes some parts in like this. Of course, you could always get a standard PLL and start from there. BTW, the EXAR people have several data books that have tons of MODEM and PLL circuits.

Hope this helps...

Since those frequencies are neither Bell nor CCITT V.2X, I can't direct you to an integrated modem chip. The frequencies sound like radioteletype with an 800 Hz shift - but I don't know of any integrated FSK converter chips for that application.

So, you can take two approaches:

1. Use an phase-locked loop, either a LM565 or LM567. Check National Semiconductor Application Note AN-46 for design details and examples.

2. Use a switched-capacitor filter in a narrow bandpass configuration for each frequency, with a simple op amp AC level detector at the filter output. This is a more state-of-the-art method; while more complex in design than a PLL, these filter-based FSK detectors are far superior to a PLL. Consider the National Semiconductor MF-10 as a starting point, and get a copy of the National "Switched-Capacitor Filter Handbook" for design details.

> Also, I would like to
> find a device that will convert frequency to voltage, continuously,
> over the same range.

Consider the National Semiconductor LM2907, which is a building

block circuit providing F/V conversion for tachometer and other applications.

Hr ARRL Bulletin Nr 84 From ARRL Headquarters
Newington CT October 24, 1986, Edited by K1BC
To All Radio Amateurs BT

The Electronic Communication Privacy Act of 1986, most recently known as HR 4952, was signed into law by President Reagan on October 2. It now is known as Public Law 99-508. Meanwhile, the Senate report number 541 which explains the bill is at the printer. Requests for copies may be filed through the offices of senators and representatives. Additional information will be in the January issue of QST. AR

> device, using a detector which completely enveloped it.

While I don't work with radiation measurement on a regular basis, I'll take a stab at giving you an answer.

Tritium, being a radioactive isotope of hydrogen, is a beta emitter. The inherent beta energy of tritium (0.0186 MeV, as you pointed out) is quite small. It takes at least 0.070 MeV of beta energy to penetrate the skin.

X-rays are produced by an effect called "bremsstrahlung" (don't ask; it's a German word, but that's the proper term), which occurs when a high velocity charged particle (usually electron, but also beta particle) strikes a target and is slowed down. In this case, the target is the glass tube.

Since I don't know the thickness and total surface area of the glass tube, I can't accurately calculate the activity and quantity of tritium contained therein. However, I can make a few assumptions:

1. In general, less than 1% of all beta radiation is converted to x-rays by means of bremsstrahlung. I will assume that the glass is not THAT thick so that all x-rays emitted will pass through and be measured by your physicist friend's detector.

2. I will assume the tritium source is emanating (40)(100)= 4,000 cps of beta radiation. Activity is measured in Curies (Becquerels, for you SI fans). (4,000)/(3.7*10**10)= 0.11 uCi. That ain't much. Say, even 10 times that figure (I doubt it's more than that) - or about 1.1 uCi. That still ain't

much, and is less radioactivity than the americium in a home smoke detector.

3. Assuming, worst case, that you have 1.1 uCi of tritium, and you were somehow able to ingest it all (you can't get any worse than this!), the "CRC Handbook of Radioactive Nuclides" says that you will receive a total body dose of (1.1)(0.00013)= 0.00014 rems. The NRC says that the natural background radiation dose for the U.S. is something like 0.1 rem/year. So, in comparison, your tritium lamp shouldn't pose much hazard - even if I were incorrect by two orders of magnitude!

Tritium has a half-life of about 12.6 years, and I would guess that for this lamp to be sold as "surplus", its age is probably approaching that half-life period.

I have two points of caution: (1) Just because it appears that the quantity of tritium contained in the lamp is miniscule, doesn't mean you should do something DUMB with it - like break open the tube, allow children to play with it, or keep it in your pants pocket :-); and (2) my calculations are all based upon the disintegration rate which your physicist friend claims to have measured, so if his measurement is wrong, then so are my calculations!

I have a couple of questions that I'd like answered for a friend of mine who's not on the net.

1. Is there any software available for the Macintosh for decoding transmitted wire services (such as AP, Reuters)? If so, what is the name of the software and where can he get more information? Are there special hardware requirements?

2. In the absense of Mac software for decoding, does anybody know of software houses that have written non-Mac software whom he could contact about possible Mac versions?

3. Is there public domain software of this sort available for any machines?

Please send me mail as I generally don't read this newsgroup. I'll summarize if there is interest...

------------ Thanks in advance!! -----------

WANTED: HAM TEST PRACTICE SOFTWARE FOR ELEMENT 2 & 3A

I'm looking for the latest HAM test practice software for

written Element 2 and written element 3A. I have the 4.1
version but it's now outdated since 1994.

If someone could send a copy to me I would appreciate it.

My email address is:

barretta@mci2000.com

Thanks

                Before the   PR
        Federal Communications Commission   FCC 86-18

Washington DC 20554 36413

In the Matter of)
)
Amendment of Part 97 of the) PR Docket No. 85-105
Commission's Rules to permit)
automatic control of amateur) RM-4879
radio stations.)

REPORT AND ORDER

Adopted: January 13, 1986; Released: January 16, 1986

By the Commission:

1. On April 5, 1985, the Commission adopted a Notice of Proposed Rule Making (50 F.R. 15196; April 17, 1985) to permit any amateur station to be under automatic control provided that operation was on frequencies above 29.5 MHz and that no third-party traffic was transmitted. This was an expansion of the proposal requested by The American Radio Relay League, Inc. (ARRL), who had requested automatic control only for stations transmitting digital communications while operating on frequencies above 30 MHz. Nineteen comments and one reply comment were filed in this proceeding. (1)

2. Our Notice of Proposed Rule Making in this proceeding, _supra_, particularly invited amateur radio operators experienced in automatic control to submit comments on the practicality of expanding automatic control to encompass all amateur operations, not just digital communications. Such comments were not forthcoming. Because of the lack of user support, we will adopt only the ARRL's recommendation to limit automatic control to digital communications on very high frequencies (VHF) and above. (We select 50 MHz rather than 30 MHz, as the petitioner requests, because there are no amateur frequencies between 29.7 and 50 MHz).

---

(1) Comments filed by the American Radio Relay League, Inc., (ARRL), Robert C. Clements, Jess de la Cuesta and Joseph Anthony Wolos were filed late. Consideration of the viewpoints expressed in those comments will aid in the resolution of this proceeding. Therefore, we accept them.

---

3. In the Notice, _supra_, we reminded amateur operators that the current rules require the presence of the control operator at the station control point whenever third-party traffic is being transmitted. We emphasized that the proposed amendments would still prohibit automatic control of the station when it is transmitting third-party traffic. Some commenters were confused about unsupervised third-party traffic.

For example, repeater stations are already permitted to be operated under automatic control. However, as with any amateur station, when they are transmitting third-party traffic, the control operator must be present at the control point monitoring and supervising the transmissions.

4. Many of the commenters request that high-speed digital operating modes, such as packet-switching, bulletin boards, computer based message systems and electronic mailboxes be exempt from the requirement that the control operator supervise third-party traffic. They believe that the third-party rules as applied to such high-speed digital communications are impracticable and would, in effect, nullify the advantages of automatic control. To acquiesce in that request would be inconsistent with other types of amateur operation. Third-party traffic is radio communications on behalf of anyone other than the control operator.(2) Neither the speed at which the message is transmitted nor the emission mode (voice, telegraphy, digital etc.) changes its character. This was pointed out in our letter of October 19, 1978, to Richard L. Baldwin, then General Manager of the ARRL.(3) In that letter, we reiterated that unsupervised third-party traffic by amateur stations is not permitted.

5. Some comments suggest that the third-party traffic rules be amended so that they would be applicable only at the time the third-party traffic is first introduced into the amateur communications system. However, screening the message content at its introduction does not change the character of the traffic. It is still third-party traffic which must be closely regulated in the non-common carrier Amateur service. Otherwise, amateur facilities and frequencies would be open to non-amateurs and could eclipse other amateur uses. Moreover, we are also concerned about the final destination of the message. We do not want to give our approbation to a mechanism which could be used to circumvent the international Radio Regulations which forbid exchange of amateur third-party traffic between countries who are not parties to agreements permitting such traffic.

---

(2) Section 97.3(v).
(3) FCC 78-742; 70 F.C.C. 2d 1303. See also News Release No. 2028, October 25, 1978.

International third-party radio communications are prohibited by Section 97.114 of the amateur rules and Article 32, number 2733 of the International Radio Regulations (Geneva, 1979), except where arrangements have been made between the two countries involved, Article 32, number 2734.

6. Some commenters suggest that MF and HF frequencies between 1.8 and 29.5 MHz be added to the frequencies available for automatic control or that automatic control be extended at least to all digital communications below 29.5 MHz on a regular basis or by temporary special authority (STA). They state that coast-to-coast coverage for

point-to-point message handling would be accommodated by including MF and HF frequencies. Because of the possibility of congestion on the MF and HF frequencies, we do not believe that it would be advisable to permit automatic control on those frequencies.

7. Robert C. Clements is under the impression that we inserted a clarification into the proposed Section 97.79 (b) that the station licensee is presumed to be the control operator of the station, unless there is documentation to the contrary. However, this is essentially the same as the present wording of Section 97.79(b). The words "at all times" will be deleted from this rule in order to be consistent with the revised wording of Section 97.3(m)(3).

8. For the reasons given herein, we amend our rules to permit automatic control only for digital communications on amateur frequencies 50 MHz and above. Further, we affirm our present rule that requires the control operator to be present at the control point whenever the station is engaging in third-party traffic.

9. IT IS ORDERED, That Part 97 is amended as set forth in the Appendix hereto. This action is taken pursuant to the authority contained in Sections 4 (i) and 303 (r) of the Communications Act of 1934, as amended.

10. IT IS FURTHER ORDERED, That these rule amendments shall become effective, March 14, 1986.

11. IT IS FURTHER ORDERED, That the Secretary shall cause a copy of this Report and Order to be published in the Federal Register.

12. IT IS FURTHER ORDERED, That this proceeding is terminated.

---

13. Information in this matter may be obtained by contacting Maurice J. DePont, (202) 632-4964. Private Radio Bureau, Federal Communications Commission, Washington, D.C. 20554.

FEDERAL COMMUNICATIONS COMMISSION

William J. Tricarico
Secretary

Attachment: Appendix

APPENDIX

Part 97 of Chapter 1 of Title 47 of the Code of Federal Regulations is amended, as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended;
47 U.S.C. 154, 303.

2. Section 97.3 (m) (3) is amended to read:

Sec 97.3 Definitions.

* * * *

(m) * * *

(1) * * *

(2) * * *

(3) _Automatic control_ means the use of devices and procedures for control without the control operator being present at the control point when the station is transmitting.

3. Section 97.79 (b) is amended to read:

Sec 97.79 Control operator requirements.

* * * *

(b) Every amateur radio station, when transmitting, must have a control operator. The control operator must be present at the control point of the station, except when the station is transmitting under automatic control. The control operator must be a licensed amateur radio operator or permittee designated by the station licensee. The control operator and the station licensee are both responsible for the proper operation of the station. For purposes of enforcement of the rules of this part, the FCC will presume that the station licensee is the control operator of the station, unless documentation to the contrary exists.

---

4. Section 97.69 is amended by adding a new paragraph (d), as follows:

Sec. 97.69 Digital communications.

* * * *

(d) An amateur station may be under automatic control when transmitting digital communications on frequencies 50 MHz and above.

5. A new section 97.80 is added, as follows:

Sec. 97.80 Operation under automatic control.

(a) When under automatic control, devices must be installed and procedures must be implemented which will ensure compliance with the rules when the control operator is not present at the control point of the amateur station.

(b) No amateur station may be operated under automatic control while transmitting third-party traffic.

(c) Automatic control of an amateur station must cease upon notification by the Engineer-in-Charge of a Commission field office that the station is transmitting improperly or causing harmful interference to other stations. Automatic operation must not be resumed without prior approval of the Engineer-in-Charge.

6. Section 97.114 is amended by adding a new subparagraph (4) to paragraph (b) as follows:

Sec. 97.114 Third-party traffic.

* * * *

(b) * * *

(4) Third-party traffic from an amateur station under automatic control.

* * * *

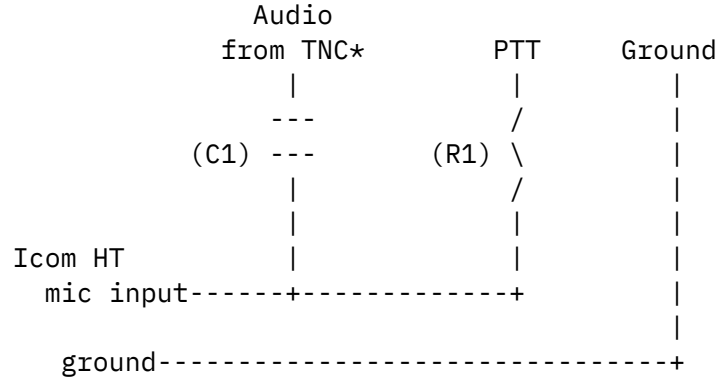
I made a big mistake in the previously-posted schematic of
the connection between an Icom IC-2A, 2AT, or 02AT and a
packet radio TNC, RTTY afsk unit, or another microphone.
The resistor and capacitor were backwards. The correct
schematic follows:



C1 - 0.47 uf capacitor
R1 - 25K resistor

* TNC or RTTY afsk or another microphone or whatever you are
  interfacing to your Icom HT.

What has happened to Radio Earth on KCBI. I haven't been listening to
shortwave for a while so it was just recently that I noticed the program
was missing. Anybody have information on it?

Ok folks, time for another great survey. I am interested in comments
and recommendations for 2 meter base antennas, both omni-verticals
and beams, but my real interest is the verticals. Which one do you
use, how does it get out, which ones have you used and hated??

Here is your big chance to help someone buy the "right" antenna.

> ... 2 meter base antennas .... Which one do you
> use, how does it get out, which ones have you used and hated??

I have two types of 2 meter vertically polarized, omni-directional antennas:

1. Cushcraft AR-2: the original Ringo (not the Ranger). This antenna works better than a 1/4 wave ground plane, but not by much. The real advantage is its small size and its transportability. I've used Ringos on towers, on porches, in attics, and in dorm rooms. If I recall correctly, the coax connector needs a healthy amount of weatherproofing, as its center pin is exposed.

2. Hustler G6-144: originally advertised by Newtronics as the "Master Gainer", and discounted to $69. Built very, very well - more like a commercial grade antenna. Spray it with Krylon (tm), and this antenna outlast its owner. Stainless steel hardware. I don't remember any self-tapping sheet metal screws (ala Cushcraft), rather high quality hose clamps. Thick, solid radials and machined aluminum base. Performance much better than the Ringo, but 10' tall.

Summary: This is important!

This Report and Order states in no uncertain terms that third-party
traffic may not be handled without a control operator present. But
what really struck home was the iteration of Part 97, "third party
traffic is traffic on behalf of anyone but the control operator."

That DOES NOT make an exception for traffic that originates from another
amateur radio operator.

That means no mailboxes, no RBBS, no network news reading without a
system control operator monitoring.

It's getting harder and harder to play by the rules.

Mojo, AA4KB

SHUTTLE SEARCH CONTINUES

Bob Parnass

Combined units of the US Navy, Coast Guard, and NASA are continuing their operations today off the Florida coast for debris from the Space Shuttle. Several units were monitored in the operation, including:

- USCG Cutters Point Roberts, Dauntless, and Dallas

- USS Samson

- Navy Patrol Boat 778

- USCG Search and Rescue Aircraft 1710

- USCG Search and Rescue Helicopter 1430

- Navy Rescue Aircraft 322

Primary frequencies involved appear to be 5.680 MHz (usb) and 282.8 MHz.

Data Marking Buoys(DMBs), which transmit signals on UHF, are being dropped by aircraft where wreckage is spotted. Try listening for a buoy on 240.6 MHz if you live near the affected area.

Mike, I use a Hy Gain V2S 2m omni antenna and am very pleased with it.
It is the same design as the Ringo Ranger II and isopole, ie, 2 stacked
5/8 elements with decoupling sections. The Isopole uses those stupid
looking cones to do the decoupling while the Ringo and V2S use short
element sections. The thing has been outdoors for 4-5 years and shows
absolutely no signs of wear. All the hardware is still shiny clean.
Another good thing about the V2S is its swr. It's basically flat across
the entire 4 MHz band. It is about 7-8' tall and weighs just a few pounds.
I didn't mean this to sound like a commercial, but I really am pleased
with it's performance.

73,
Al Rovner, WA2TMP

qst de k9eui
hr arrl bulletin nr 8 from arrl headquarters
newington ct january 23, 1986
to all radio amateurs bt

fcc has released a report and order in pr docket 85 105
allowing automatic control for digital operation on frequencies
50 mhz and above. automatic control privileges continue for
repeater, auxiliary and beacon operation. the new privileges
are effective march 1986.

there is a dark lining in this silver cloud. a major goal in
the securing of automatic control privileges for digital
operation at 50 mhz and above had been the facilitation of
packet radio data transfer, computer to computer communication
and packet switching systems. such operation has continued to
be hampered by the requirement that a control operator be
present when third party traffic is handled. fcc has provided
no relief in this quarter in its report and order in pr docket
85 105. fcc found that neither the speed with which a message
is transmitted, nor the operating mode, justified any deviation
from the rule requiring that the control operator of an amateur
station be present at the control point whenever a station
engages in third party traffic. under these circumstances, the
expanded automatic control privileges gained through 85 105 may
be a hollow victory. arrl response to this apparent setback
for packet radio is scheduled for discussion at the january
arrl board meeting, in progress at this writing. watch w1aw

qst de k9eui
hr propagation forecast bulletin nr 4 from arrl headquarters
newington ct january 27, 1986
to all radio amateurs bt

through the 26th, solar flux numbers for january are lower than those for the same days in the previous solar rotation on all but 6 days. on 3 of these 6, the figures were the same as the last time around. unless something unexpected happens this week, january will be about 1 unit per day lower than december. this is not unexpected, in what could be the last full year of this solar cycle, but it does not necessarily follow that the rest of this cycle will show a steady decline. the final months of the 3 other cycles for which accurate flux readings are available do not show a consistent daily dropping off, except on a long term, smoothed basis. from the middle of august to the middle of october 1985, the flux was never above 73, and much of the time is was in the high 60s. september averaged only 69.5. but since the middle of october we have had 4 days in the 90s, and 54 days of 75 or higher.

the importance of these statistics is that for the fall and early winter dx season in the northern hemisphere, the sun was active enough for fairly good coverage on all bands except 28 mhz for nearly half of the days. on at least one third of the days we could have done fairly well, even on 28 mhz. solar activity does not rise and fall in smooth or symmetrical curves. it is likely that, except in the few weeks when we move from cycle 21 into cycle 22, we will not see dx conditions generally very different from those we have lived with over the

past year or so.

for the forecast week, we will be operating with the solar flux and sunspot numbers very close to the minimum quiet sun levels. this means that our nightime dx work will be done mostly on 10 mhz and lower frequencies. the 14 mhz band, always crowded, will tend to be even more jammed in daytime hours. how early it opens, and how late it stays open, will depend upon the solar flux numbers, and they will never be much worse than during this week.

we are in a geomagnetically disturbed period as this bulletin is being prepared. this should be over about january 29. the solar flux will be rising by the end of this week. the next major geomagnetic disturbance is expected about february 3 to 4.

there were no visible sunspots for the week january 16 to 22

Radio Earth is no longer on KCBI Dallas, Texas. It is now broadcast over World Harvest Radio International (WHRI) at 0300 UTC (10 PM EST) on 7400 khz.

I read an article in the International SW Guide about this and the reason for the change was that only about 25% of the usual listeners were tuned to the broadcast over KCBI at 1900-2000 UTC.

Radio Earth plans to broadcast from their own 50kw station in the future from Curacao.

....
Some traffic from the space shuttle recovery crews has also been
noted on 5320 khz.

....
I am looking for World Radio TV Handbooks to add to my collection.
The following years are needed:

1946-1956 1958 1960 1961 1963 1967-1969 1975

If any hams out there have an amiga I'd be interested in sharing
any software or ideas on how to use the beast in a ham station.
I've written a program that 'reads and writes' morse code. The output
is just a tone in the left channel. Morse code input is via the fire
button on Joystick 2 (with my keyer wired between pins 6 and 8).
The program doesn't track the code speed yet but I'm working on that (slowly).
(This program is actually a port of one I wrote for the mac a long time ago).
I'd really like to share ideas on how to read/write SSTV RTTY etc.

Please MAIL to ihnp4!sask!hardie

I read on a BBS (un-named) that there was a group up in Oregon that
was busting the HBO stuff durring their test runs in under 30 hours.
The stuff I read went on to say that what made it easy was that they
would just go get a copy of the movie being shown and once that
they know the 'answer in the back of the book' finding the question
was easy.

qst de k9eui
hr propagation forecast bulletin nr 5 from arrl headquarters
newington ct february 3, 1986
to all radio amateurs bt

last weeks bulletin ended with a prediction of a solar flux rise, but what actually happened surpassed all expectations. a sizable new sunspot group came around the east limb january 30, but its effects had already been seen in a 7 point rise in the solar flux, beginning on the 28th. the number and size of the spots increased, and on february 2 another spot appeared, this time in the western half of the disc. the flux reached 90, its highest since last october. signals were heard on 21 mhz from africa to southern europe with w6 and w7 stations all in together. on 24 and 28 mhz the west coast call areas were also in well, working w1 and w2 land not audible in florida.

the new lease on life for 10, 12 and 15 meters could last through much of the forecast week. it may be washed out by a recurrence of the disturbance of january 7, expected about february 4 or 5.

it will be of interest to see if the lower solar flux peaks of november 15, december 16 and january 16, all apparently from one area of the sun, return in february. their effects would be maximum between about february 11 and 14. there have been no double peak months since last july, an exceptionally active month for so late in the solar cycle. vagaries in radio propagation, while frustrating at times, are all part of our great game. they may be more readily apparent in the low sunspot years, when activity on normally busy bands falls off. the author of these bulletins welcomes reports of propagation events that do not seem to fit normal patterns. send them to ed tilton, w1hdq, po box 5529, spring hill, fl 33526. please enclose an sase if a reply is wanted.

there were no visible sunspots for the week january 23 to 29. ar

qst de k9eui
hr bulletin nr 9 from arrl headquarters newington ct
january 26 1986 to all radio amateurs bt

the arrl board of directors held its annual meeting in hartford ct on january 23 and 24 1986. president larry e. prince, w4ra was reelected to serve until the 1988 annual meeting. also reelected were executive vice president david sumner, k1zz, secretary perry williams, w1ued and treasurer james e. mc cobb

jr, k1llu. newly elected as first vice president was jay a. holladay, w6ejj. leonard m. nathanson, w8rc and william j. stevens, w6zm were elected as vice presidents. tod olson, k0to, is the new international affairs vice president. replacing olson as dakota division director is the present vice director howard mark, w0ozc. serving on the executive committee, in addition to messrs price, holladay and sumner, will be directors paul grauer, w0fir, george s. wilson, w4oyi, frank m. butler jr, w4rh and hugh a. turnbull, w3abc until the 1987 annual meeting.

the board asked the president to take actions to correct the restrictive and crippling effects of fcc docket 85-105 on the development of packet radio and packet radio emergency (traffic) the order in the docket requires a control operator on duty at a digipeater when third party traffic is to be handled. the president was also asked to (garbled) equally to perform administrateve and clerical tasks which are required of any vec. a petition will be filed with the fcc requiring the labeling of home electronic equipment with regard to its susceptibility to rf energy.

the league will seek memoranda of understanding with the national weather service and with the civil air patrol concerning the service of amateurs to these agencies in emergencies. moreover, the executive vice president will promote local memoranda of understanding between amateur radio emergency service untis and the cities, towns, states and service groups they can serve. a brochure explaining amateur radio disaster capabilities, suggested by the emergency communications advisory committee was ordered to be produced and distributed to the media and served agencies. plans to continue discussing the possibility of league involvement in call sign issuance with the fcc were left in place, despite some expressed misgivings.

the board adopted a modified band plan for the 160 meter band. cw, rtty and other narrow band modes will be urged to use 1800 to 1840 khz while cw, ssb, sstv and other wideband modes can use 1840 to 2000 khz. because the segment from 1830 to 1850 is the most common international allocation in the band, amateurs are encouraged to use it only for intercontinental qsos. the board did not agree to a proposal that these subbands should be incorporated in the fcc rules at this point. the board agreed that field day activities and communications seeking award credit may be carried on in all amateur bands except 10.1 to 10.15 mhz where u.s. amateurs are required to protect non amateur services of other countries from interference. no change was made in rules for the five band awards however. in recogintion of dxcc being fifty years old in 1987, plans for a golden jubilee dxcc award will be developed for board consideration at the july meeting.

the board approved implementation of a national repeater data base at arrl headquarters, available by phone to repeater coordinators. it also decided that the repeater coordinators newsletter should be offered by subscription to the general membership, while continuing its free distribution to repeater coordinators. however, a separate action reiterates that the league is not a national coordinator and does not choose, endorse or certify coordinators. its role is to offer support services to coordinators chosen by served groups in the various parts of the country. the repeater directory indications that certain repeaters are coordinated is determined by these corrdinators and not arrl.

in other areas of interest, the board recognized with thanks the work of the federal preemption task force as having been virtually complete in the adoption by the fcc of prb1, and it was discharged. a new legal strategy committee will be appointed by the president to provide assistance to volunteer counsels in relation to antenna ordinances zoning restrictions as they relate to amateur radio and deed restriction problems. the headquarters staff was asked to prepare in consultation with experienced members in the field a guidebook for conventions and hamfests. special encouragement and support will be provided to amateur radio clubs at u.s. military institutions, particularly those at which communications and electronics training is performed. the board took two actions looking forward to the arrl 75th anniversary in 1989. the arrl will offer to host the 1989 triennial meeting of iaru. criteria for selecting the 1989 arrl national convention site were also adopted. these criteria will be published in the march and april issues of qst and selections made at the july 24 meeting from among applications received from interested groups by july 1 1986.

matters being studied by board committees include a study of message traffic overloads during disasters. a special blue ribbon committee will be appointed by the president for this purpose. another special committee will take a close look at all the advisory committees, including thier size, selection of members, tenure and financing. also to be studied is the possibility of arrl providing a tape recorded news and information service to be accessed by telephone. the feasibility of combining several arrl newsletters into one readily and inexpensively available to members will be explored by the publications committee. full details of other studies will be in the march issue of qst. ar

I found that high pressure sodium streetlights have a failure mode in which they periodically extinguish and reignite. Just before reignition, they cause severe RFI on 80m. If you are having troubles with periodic QRN on 80m, you may want to check the streetlights in your neighborhood. In my case, one lamp was cycling every 60 seconds before I had the utility replace it.

Bob:

Here in California there is a new trend... Car license plate frames

with call letters engraved.

i.e. "KA4993" (and often a city is indicated).

It has replaced the 'courtesy card' and alerts the police that either you or someone who loves you works for the 'agency'/state/pd/so/fd et al.

Any ideas what/who the above call letters belong to? A search of the POLICE CALL 1986 (the new issue is out @$7.95 {radio shack}) shows that all call letters of p.d's, agencies, state and federal, have three or four letters followed by two or three numbers.

i.e. 'KXX123 or KXXX123 or KWO37-(Los Angeles 24-Hour Weather Service, Mount Wilson, US Government).

The above letters (KA4993) do not fit this model. Any ideas?

Thanks, Bob!

Jon--Many people make QSL cards, and most of the current contenders are listed in the classified ads in the back pages of QST each month.

In terms of uniqueness--I have used black & white photographs on

my cards for many years. Just take a 3x5 picture to your local
"Instant Printing Service" or whatever. They'll make a plate or
screen (costs ~$15 but lasts forever) and then they'll run off
however many cards you want, now or anytime in the future. In
this way you can make your card as unique/personal as you wish.
Alternatively, if you know someone who's a graphics buff, have him/
her draw a unique design in camera-ready form, and take that to your
friendly local printer.

Most of the printers in QST have "stock" cards which get the job done,
and relatively cheaply. You'll find in many cases, however, that
if you buy one of these cards, you'll soon have a half dozen just
like them on your wall from other stations.

Uniqueness is going to cost you a bit more money, but I've gotten
so many compliments on my card that it's been worth it to me. And
besides, it may have gotten me some replies that I wouldn't have
gotten otherwise. I'll never know, but....

73--Jim, K6ZH

I have just been informed that all the packet BBS's are now off the air.
A ham in Florida was just awarded a pink ticket for operating a packet
BBS. I don't have many (any!) details, but the cause cited appears
to be the bit about "no 3rd party traffic while under automatic control."
(See the latest ARRL newletter for details....)

While I am not a fan of interconnecting BBS's (we know how well Usenet

works - I hope ham packet is more useful!), this materially restricts why anyone would want to use packet in the first place - computer to computer communications (yes, a TNC is a computer...).

Rumor has it that the august ARRL considers packet to vitally important to the survival of ham radio. I suggest they mount an effort at least as vocal as the last "no code" fiasco if they don't want to see it go down in flames. The next thing you know, they'll be applying the ruling to digipeaters.

"I learned the code, so now what can I connect to??"

  Does anybody know how to increase the search/scan rate on the IC-02AT? Out of the box, it's painfully slow. It was really easy to adjust on my IC-290A and on my IC-45A, but I don't remember seeing anything in the 02AT documentation (which I don't have in my possession at the moment).

  Also, I have the mods that allow Tx & Rx out of band (for the 02AT). Rx is fair to at least 162.55 MHz without retuning. I didn't bother with the Tx part of the mod. I have only hardcopy, but if I get a sufficient number of requests, I'll key 'em in and mail 'em out.

     My 1985 FCC records indicate that KA4993 is licensed to
     the State of California for several thousand mobile and
     portable units, on numerous police   frequencies. Fre-
     quencies include several between 42.08 and 42.88
     MHz,
     as well as 154.905, 154.920, and 154.935 MHz.

     The licensee's telephone number is listed as (916)445-
     6875.

As a VHF-UHF operator, I recommend that you include you VUCC Grid Square on your card. This is a world-wide system of location specification which divides the globe into "squares" of one degree N-S by two degrees E-W. There are also finer divisions of 1/10th these intervals, but they are not widely used. You will find hams all over the world using this notation, and I expect it to eventually become widely used on HF as well as the higher bands. Since you apparently live the the DC area, you are probably in FM18 (S of 77 N) or FM19. Contact me on 301-921-3274 if you want more info.

73 and gud DX

Bob W3OTC

PS. I have just gone to the local "Speedeeprint" for my last two sets of cards. The manager has a ham friend... Of course the result isn't extremely beautiful, but you will find a lot of people without 7-color cards these days....

Call letters in the form KA4993 are mobile-only licenses issued
up until a couple of years ago, presumably when they ran out of
numbers. For example, our fire department has three sets of call
letters:
     KGE609 -- Base station only at station #1
     KIT823 -- Base station only at station #2
     KC7766 -- All mobiles and portables at both stations.

This was required because the licensee name is the same on all
licenses. Mobile-only licenses issued recently have five digits instead
of four, and I can't remember offhand whether there are two, three,
or four letters in front. Recent Base-only and Base-Mobile licenses
are of the form KNxx000 -- four letters beginning with KN, followed by
three digits.

I'm in the market for a frequency counter. I don't want to spend more
than $150. Ideally it should cover 50 Hz to 500 MHz.

Are the counters you see advertised in the back of Ham Radio and similar
magazines any good? What should I look for, and look out for? Will
I be sorry if I don't get 9 digits?

Typical uses would be setting the markers on my sweep generator (4.5 Mhz,
26 MHz, 42 Mhz), setting the LO frequency in my ATV receiver (~450 MHz),
adjusting touchtone pads (remember the old ones with the big inductors?),
and similar home jobs.

qst de k9eui
hr propagation forecast bulletin nr 6 from arrl headquarters
newington ct february 10, 1986
to all radio amateurs bt

after about 4 weeks of very low activity, the sun developed a
rash of major flares and new sunspots during the past week.
from 69 on january 27, the solar flux was up to 103 by february
5. suddenly the amateur bands sounded like 1983 again. 14
mhz, which had been going dead soon after local sunset, became
almost a 24 hour dx band again. 21 and 24 mhz did almost as
well, and 28 mhz, long almost totally quiet, was running wild
again. during saturday night there was an aurora of such
intensity that even 432 mhz dx was workable on ssb, as well as
cw. 2 meter operators as far south as sarasota, florida used
the aurora to build up their grid square totals. k1tol in
maine was heard on 50 mhz in sweden by sm6pu, and the british
50 mhz beacon gb3six was heard by k1jrw in massachusetts. the
50 mhz band was open to south america hours at a time.

solar flux is on the way down now, but it may not drop too far.
the area of the sun that brought januarys highest flux reading
will be facing us again this week. it should keep things
interesting on 14 and 21 mhz, if not 24 and 28 mhz, after about
wednesday. our lowest solar flux this month is expected about
february 17 through 24. by about the 26th we should know if a

recurrence of the early february flux peak is likely.

american sunspot numbers for january 30 through february 5 were
between 9 and 58 with a mean of 35.1. this activity follows a
14 day stretch of no visible spots ar

I've owned two Heathkit counters and one el-cheapo back of the magazine
brand counter. Surprisingly, the Heathkits have been pretty good. I took
top place in the W1AW freq measuring tests a few times with the simpler
of the Heathkits. [Anyone wanna buy it? No, that's misuse of the net.
Forget I said that.]

The el-cheapo kind has very bad temperature and time stability. Usually
just a cheap crystal sitting in the middle of an ordinary PC board.

It seems to take a lot of bucks to get 500 MHz coverage. I would advise

a 50 or 100 MHz unit and an external prescaler, which is fairly cheap.

For the jobs you mention, you don't seem to need nine digits. And for the price you're looking for, you wouldn't be accurate to the last digit anyway.

Disclaimer: My info is a few years old. There may be a wonderful and inexpensive unit out there now that I don't know about.

73,
Bob, K1BC

Summary: The FCC has a point. Suggestions?

There's a very important point to the FCC ruling that we have to remember. Amateur Radio CANNOT become a common carrier! Besides providing unfair competition with the commercial carriers, it's contrary to the spirit of *Amateur* Radio as experimentalists and hobbyists.

Now how do we tread the fine line and operate our packet BBSes? If there really is no control over third party traffic on Amateur Radio, then we start to cross that line. I think at the very least we'll have to emphasize clearly the nature of the third party traffic that will be permissable (non-business, trivial, experimental -- following the guideline that "Amateur Radio traffic must be trivial to the degree that recourse to the established commercial carriers is not

justified").

I also think we're going to have to provide more control over the
BBSes -- more control operators and control points. It may mean
a set of rules for designating BBS users as control operators, and
providing protected access.

It won't be easy, but we can find a way to live with it.

Personally I think the spectrum should be chopped up and sold to
the highest bidder ....

Lines: 29
Keywords: MFJ 1024, ICOM R71A

I have recently returned to the hobby of shortwave listening after an absence of over 10 years. I recently bought an ICOM R71A receiver, which is far better than the National HRO-60 I used to use. I am having a problem concerning the choice of a proper antenna for Shortwave Listening.

I live in a third floor apartment. Currently I am using a 30' length of wire which lies around the perimeter of my listening room. I am not permitted to run wires outside my window, nor am I allowed to hang any wires from my balcony. My only alternatives for an antenna are a long wire strung around the room, or perhaps an active antenna.

I am considering purchasing a remote active antenna, such as the MFJ 1024. This antenna is small enough (only 54 inches) to be mounted outside, on my balcony. My other alternative is to purchase an antenna tuner and attach my 30' length of wire to it.

My question is: Which will give me better performance, an outdoor-mounted active antenna, or an indoor 30 foot longwire antenna with an antenna tuner? It has always been my understanding that a properly constructed long wire antenna mounted outdoors will outperform an active antenna. But since my "long wire" antenna can only be 30 feet long, and can only be indoors, I am thinking that the outdoor active antenna might give me better performance in this case.

I would appreciate any opinions and advice concerning this matter.

I am also interested in the same information. There are two tuners that I know of that are for random longwire antennas. One is by MFJ (I forget the model number) and the Mini-Tun by Grove Enterprises. Does any body have information on these tuners?

I have been wondering about the Sony active antenna (or remote
antenna tuner?) advertised in the back of the instruction book
that came with the ICF-2002 I just bought at a hamfest.
It looks expensive, and all I know is from the picture
in the booklet. Probably not many stores carry such a thing.

Does anyone have any experience, or even price info, on this
gadget? I'm pretty sure it would work with any radio,
as the antenna connections on the ICF are nothing special.

I posted an article on the MFJ 1020 indoor active antenna over a year ago, but have since replaced my ICOM R70 with an R71A and Drake R7, and moved to a house with a lot of land.

I don't know how the MFJ 1024 outdoor active antenna stacks up against the indoor model, but I can recommend the indoor unit as long as you connect 20 or so feet of wire to it. In my case, the wire was lying on the floor inside my 2nd floor apartment, then wrapped around the inside of a window frame. Being tucked between the plaster wall and the frame, the wire was hidden from view.

I still use my MFJ occasionally as a preamp for my out-
door 75' wire. It seems to perform as well as, or better than, my Ameco FET preamplifier.

MFJ offers a limited time free trial of MFJ equipment if bought directly from MFJ. A friend also wonders about the 1024 and said he will take advantage of the free trial. He bought a 1020A last week and uses it with a short outdoor wire from his apartment. If you
do buy the MFJ 1020, be sure to run it from 12 VDC rather than 9 VDC, to get best results.

ARTICLE FOLLOWS:

MFJ 1020 Active (Indoor) Antenna

Bob Parnass, AJ9S

The MFJ 1020 Active Antenna consists of a telescoping antenna and a preselector-type circuit inside the now familiar beige and wood grain cabinet. The frequency coverage of approximately 200 KHz to 30 MHz is divided into 5 bands.

A small, external power supply is required, but not provided.

The 1020 lists for $80 new, but I purchased it at a hamfest for $20, and performed one minor repair (replaced a fiber washer at the base of the telescoping antenna). I use this unit with an ICOM R-70 general coverage receiver. Overall, the MFJ 1020 works better than expected, although still not as good as an outdoor antenna.

The Bad News

Phono jacks are used rather than the SO-239 type.

The inclusion of an LED indicator lamp in the 1020 really precludes the prolonged use of any internal battery.

One problem with my particular unit is that, despite the dial markings, coverage ends at about 28.5 MHz (rather than 30.0 MHz). There is no simple trimmer capacitor that can be adjusted as a remedy. One of these days (yawn), I'll have to trim an inductor.

Active antennas are more prone to electrical interference. A photoelectric nightlight in an adjacent room causes a high QRN level, due to the SCR in the dimming circuit, and must be disabled during listening periods. Emissions from the horizontal oscillators of TV sets in the building also cause problems.

Use of a narrow band (tuneable, in this case) antenna makes "instant QSY" impossible. One cannot make full

use of the broadband capabilities of the new generation of general coverage receivers. This is a shame, especially if one has a receiver such as the ICOM R-71 or the Kenwood R2000 which contain several memories.

A guy at work asked me for the address of Handi-Hams. After thinking about it I thought that there might be other people out there who might want it too:

Here is the address of Handi-Hams. Handi-Hams is an organization of handicapped and non-handicapped people who help other handicapped people get licensed and on the air. If you know of a handicapped person, licensed or unlicensed, who would like assistance or if you would like to help, contact Keith Graham who is the director:

Keith Graham
Handi-Ham Systems
Courage Center
3915 Golden Valley Road
Golden Valley, MN 55422

The preceding information was given to me by Gayle WA1OPN from Worcester, MA. Gayle is a blind and deaf Amateur also

suffering from MS. She is limited to CW operation only but is in the process of getting the necessary equipment which will allow her to operate packet. As anyone who knows Gayle will agree, she is an inspiration in the truest sense of the word. Despite her three handicaps, she earned an extra class license, teaches radio theory to people around the world, holds two part time jobs and writes articles about computers and the handicapped which have been published in several languages. She has received many awards including a commendation from President Reagan.

I've recently purchased an AN-1 with an ICF-2010. The AN-1 cost me $79,
the 2010 was $269 at Whole Earth Access in Berkeley. The AN-1 looks like
it would work with any receiver imaginable: it comes with a cord with two
mini-plugs, a cord with a mini-plug and a pair of alligator clips, a

"coupler" to slip over a telescopic antenna, and a "coupler" to rest the
receiver on.

Since I've never had an outdoor antenna here, it's hard for me to evaluate
its performance except to say that it certainly improves the signal
strength and quality of the telescoping antenna.

My only complaints with the AN-1 are that it requires six AA cells, and
although there is a jack for 9vdc input, no ac adapter is provided.

CommunicationsWeek -- Monday, February 10, 1986 -- Page 9.

By Karen Lynch

WASHINGTON -- The Justice Department is expected to drop its opposition to legislation protecting the privacy of new communications technologies against unauthorized interception, congressional sources said last week.

Congressional and industry representatives have been meeting with Justice Department officials to counter what they had characterized as the departments misunderstanding of some parts of the bill.

The meetings have also been used to redraft portions of the legislation to alleviate some of the departments concerns, Sen. Patrick J. Leahy, D-Vt., said last week.

Leahy is sponsoring an electronic communications privacy bill in the Senate, and Rep. Robert W. Kastenmeier, D-Wis., chairman of the House Subcommittee on Courts, Civil Liberties and the Administration of Justice, has an identical bill pending in the House.

Both bills would protect cellular radio, electronic mail, private networks and other transmission systems and services not now covered by the federal wiretap law. The bills would prohibits the FBI from accessing such communications without court orders, and the measures would assign penalties to private citizens unlawfully interception transmissions.

Last November, James Knapp, deputy assistant attorney general of Justice's Criminal Division, charged that the legislations could "unnecessarily complicate procedures" without enhancing individuals' rights of privacy.

Now, however, "Justice is beginning to approach it more and more

with a non-idealogical bent," Leahy said. "I think they'll sign off."

Attorney General Edmund Meese has given the go-ahead for the Justice Department to support the legislation if some modifications are made, said David W. Beier III, counsel to the subcommittee Kastenmeier chairs.

The industry has shown willingness to make some of those changes, said Philip Walker, general counsel, regulatory affairs, for GTE Telenet Communications Inc. One of the department's concerns has been the high level of protection the bill gives data from government access before and after transmission, he said.

Kastenmeier's subcommittee will host the department at a hearing at the end of the month, and the subcommittee will vote to send the bill to the House floor.

"It would be an absolute shame if we couldn't put it through this year," Leahy said, calling his bill "one of the least controversial" in Congress.

Leahy warned, however, that the bill would have to be moved by this summer. Otherwise, debate over taxes and the budget, along with this year's national elections, could bump the communications privacy measures to next year.

Senate Subcommittee on Patents, Copyrights & Trademarks counsel John Podesta said it is unclear whether the communications privacy bill would move separately or along with a computer crime bill also pending in Congress.

GTE's Walker said the customers are expressing increasing concern about the security of their electronic mail transmissions. Still, lack of security has not proven a deterrent to the business, he said during a press briefing his company held on the privacy bills.

I have very little experience with sending QSL cards to DX stations, besides sending via the bureaus (and now the ARRL's outgoing card service). I would appreciate info on the hows and wherefores. Some specific questions are: 1) When do I know that sending via outgoing bureau is a no-no and that some more direct action will be required? 2) How do I deal with IRC's? 3) A couple of years ago I QSO'ed HZ1TC, who gave an OE3xxx as a QSL manager. How do I handle this? 4) Has this all been written up in QST some time in the past 10 years? If so, a reference to such an article will probably save considerable typing wear-and-tear.

Thanks in advance and 73 -- Bruce (K1FFX - brosen@bbn-spc.arpa)

Actually, *my* favorite "engineer/physicist/mathematician" joke is as follows:

An engineer goes to bed. He is rudely awakened in the middle of the night
to discover that his wastepaper basket is on fire. He jumps up, runs
to the bathroom, grabs a bucket, fills it with water, rushes back to
the fire and empties the bucket on the fire. Satisfied that the fire is
out, he goes back to bed.

A physicist goes to bed. He is rudely awakened in the middle of the night
to discover that his wastepaper basket is on fire. He jumps up, runs
to the bathroom and pauses. Taking into account the chemical composition
of the fire's fuel, the available oxygen concentration and thermal
output of the fire, he fills the bucket with just enough water to put
out the fire. He then runs over to the trashcan and dumps the bucket.
Satisfied that the fire is out, he goes back to bed.

A mathematician goes to bed. He is rudely awakened in the middle of the night
to discover that his wastepaper basket is on fire. He jumps up, thinks
for a moment, and then goes back to bed confident that there exists
a solution to the problem at hand.

Phil

I saw a silent one-reeler from about the time of WW1 with the same
thing. the carpeneter fills a barrel of brick, unties the rope, strikes
his head on the pully, the bootom falls out of the barrel, the carpenter
falls and the remains of the barrel falls on his head.

qst de k9eui
hr propagation forecast bulletin nr 9 from arrl headquarters
newington ct march 3, 1986
to all radio amateurs

as you may have observed, conditions on 14, 21, 24 and 28 mhz have been running better than predicted by the monthly qst propagation charts much of the time since early february. if you copy solar flux information from wwv daily you know why. the solar flux reached 103, 30 points above the base figure used for the qst charts, on february 5 and it was at or above the base figure most of the time, except for a few days just after the middle of february.

the solar flux is currently following its february curve almost exactly. it was up to 89 at bulletin time, high enough to make things hot for the arrl dx contest phone weekend, march 1 and 2. the first of two active areas of the sun, responsible for the february peak came around the east limb of the sun again march 2, still looking lively. the flux is running higher than would be expected from that one group, so the second may be contributing, as it did last month a few days before its actual appearance around the east edge of the solar disk.

fast rising solar flux curves mean increased geomagnetic activity, and increasing absorbtion of signal energy, especially on high latitude paths. such conditions may be accompanied by increased signal levels and higher muf, on north south paths and other low latitude or transequatorial circuits. these effects were common during early february, even to the extent of 50 mhz openings to south america, and major auroral periods on 144, 220 and even 432 mhz. watch for more of the same around march 8 and 9. more conventional propagation is generally good just before and just after such disturbances. watch march 3 through 5 and 10 through 11. our lower frequencies should be working well around the middle of march and whenever the wwv k index is 2 or lower and the solar flux

is in the low 70s or high 60s.

american sunspot numbers for february 20 through 26 were
between 0 and 6 with a mean of 2.6 ar

[line eater offering]

Someone posted a message asking if others would like to see
the mods required for tx/rx on a 02at. I can't remember who
posted it (except that it was a N2...), and our stinkin net
daemon deleted the message.

Could that gentlemen please send me (or post) the mods to the
02at? I have several people who have asked me to forward the
information that I don't have yet. I'd be glad to collect it
all and forward it...

And my question still remains: Anyone with knowledge of how to
modify handhelds to receive and/or transmit in the public
service range (~150-162) - please forward a copy of instructions
and I'll re-forward them. Especially for the 02at, 2at, Kenwood
2500 and 2600 (those are the ones I'm hearing interest in...)

To those who sent me mail requesting copies of the above: Don't
fret - I still have your name and will forward when I receive a
copy.

thanks!

bruce

Added: About the joke I sent - I found out it isn't original -
I've received about 10 copies of the (supposed) first issue.
sigh at least it was interesting (hi hi)

For Rich and all the other radio history buffs,

The book that I was talking about the other day is "The Continuous Wave,
Technology and American Radio, 1900-1932" by Hugh G. J. Aitken: Princeton
University Press 1985. ISB N 0-691-08376-2

The book is about the transformation of radio in this country from the spark
thru, arcs, the huge alternators and then to vacuum tubes. The book covers
all the companies that I had heard about in the dim, dark days of the past,
like NESCO, GE, Federal, the various de Forest companies and even the
formation of RCA. Some of the names of the heros are Alexanderson, Bullard,
Elwell, Fessenden and Armstrong just to mention a few. Did you know that all
of Armstrong's patent on the superhet was tossed out by the Supreme Court?
Most were given to Frenchman who claimed to have invented it and shown it to
Armstrong during WW1. The book is full of all kinds of interesting stuff.

Amateur radio gets a pretty good mention in the book. I doubt if the author
is a ham?

See you on '79 next time in Yuma.

Sid

Is there a particular type of end-fed antenna that performs better than
others on 40 meters ? XYL-imposed aesthetics dictate I use an end-fed
antenna, and the random horizontal wire I put up is a marginal performer
at best, even with a resonant counterpoise. . . .

Tnx es 73,
N6MNI - Jeff

An interesting item crossed by desk yesterday. Here at NOSC in San
Diego, we have a group of Atmospheric Physics types who specialize
in propagation modelling and prediction. Dr. Adolf Paul has what
appears to be THE model for predicting sunspot numbers. He was the
first, and for quite a while the only, guy to predict the huge peak
we had in 1980.

His forecast for the next peak is attainment for a short time of
just over 100 in 1990 (the peak in 1980 was more like 170). Even
worse news is the peak for 2000 is forecast at about 80. We won't
see 100+ again until many of us won't be here to see it anyway!

I have a handy 1-page writeup about this with a chart of sunspot cycles
from 1940 to 2040. If the request list isn't TOO long, I'd be willing
to mail it to interested parties. The diagram would be kinda hard

to put on the net!

I am new to this net, so please pardon my ignorance.
What is the difference between the net.ham-radio and the
net.ham-radio.packet boards?

And, does anyone know of a small antenna that I could put
in a dormatory room? I left my rig at home because I have
no desent antenna system for such a small area. Keep in
mind that I also have to think about interference with
radio and tv's being so close. Any help is appreciated...

73...

Sorry for the wide distribution, but this stuff COULD show up at a
Deerfield, MA. flea! --Brad N6BDE

VHF/UHF AMATEUR GEAR STOLEN!!!

The following equipment was stolen from Kit Blanke's (WA6PWW) truck while visiting Glen Thomas (WB6W) Thursday, Mar. 6. The Milpitas, CA. police have this info, too (Milpitas PD Case #86-4704). If anyone finds any of this stuff, they should contact the Milpitas PD at (408)942-2400, or Kit at (home)408-263-8944 or (work)408-987-9669. Thanks.

Kenwood TH41-AT w/large battery pack.	Serial #5060830
Kenwood TM-401A 440 MHz transceiver.	Serial #4031165
Kenwood TM-201A 2-meter transceiver.	Serial #3122014
ICOM IC-3AT 220 MHz HT w/BP-8 battery.	Serial #14902168
Tempo S-1 2-meter HT w/o a battery.	(Milpitas PD has Serial #)

NOTES: The TH41-AT and IC-3AT have charged batteries, so someone could show up on the air with them.

The Tempo S-1 has Glen Thomas' driver's license number and OLD call (WB6YZI) engraved in the bottom.

The TH41-AT has Kit's call written in indelible ink on the radio. It is on the back of the radio, and only visible when you remove the battery pack.

The TM-201A has no antenna connector on it. The connector was yanked off when the radio was removed from the truck. (The connector hangs from the back of the radio on a coax pigtail. The pigtail broke, so there would now be a short piece of coax coming out of the radio with no connector on it.)

de Frank Kibbish, WB6MRQ.

Maybe this is related to the article some years ago stating that the neutrino
flux measured in the 1950s from the Sun was gone when the measurements were
repeated in the 1970s. The conclusion was that the thermonuclear reaction in
the Sun had gone out and we were living on stored heat. Mmm..., no wonder the
winters seem to be getting gradually colder.

This is a repost for those who missed it the first time around.

Band Expansion Modification For The IC-02AT

By LTC Steve Peter, CAP

---

1. Remove back from radio (9 screws must be loosened).

2. Carefully remove radio chassis from front case by pulling out top of radio and lifting slightly (to remove contacts from bottom case.) Be extremely careful of ribbon cable and heat sink compound on power amplifier module.

3. While leaving case of radio face down, there are two diodes visible near top of case (diode range board sticks out a little from under the tone board). The diode on the right should have the top lead lifted by touching with a hot soldering iron. This can be accomplished without removing any board since diodes extend just from beneath top PC board. Leave other end of diode (which is under the top board anyway) alone. The diode can easily be reconnected if necessary. If you remove the wrong diode, the coverage range will be reduced rather than expanded. If you do not desire to transmit out of band, you may skip to the step that mentions adjusting the VC.

4. Using wire cutters, snip the top lead of R182-470K ohm resistor (yellow-violet-yellow). This resistor is next to IC-102.

5. Next, tack a wire on to pin 13 of IC-102 and run to ground connection. I used the PTT ground near the switch. Dress wire to avoid pinching. This now allows the transmitter to operate on any frequency the VCO will cover.

6. Install radio chassis back into front cover. Leave back off temporarily.

7. Carefully apply power to radio and enter a frequency on the 160 MHz band. (I recommend the continuous weather 162.55 etc.)

8. With power still applied adjust slug on VCO (not the trimmer cap) in a counter clockwise direction until receiver hears desired station. This sets the upper limit of your range and is about 1/2 to 3/4 turns from where it was set before.

9. If you have a counter you can set the upper frequency you wish to use and adjust the VCO until the counter reads proper frequency. (I adjusted for upper frequency of 165 MHz and radio will still transmit on 140 MHz which will cover all appropriate VHF frequencies.)

10. This completes the modification. A few words of caution:

a. The radio is not type accepted for use in the commercial band.

b. Make sure you install the battery latch correctly on bottom of radio, or battery will become permanently locked onto radio.

c. Tighten screws on bottom of radio snuggly. If they loosen while battery is connected you cannot remove the battery. (This has happened to many units and it would be prudent to periodically check these screws to assure their tightness.)

d. If you do not adjust the VCO after the mod, the radio will cover approximately 133 MHz to 155 MHz as it comes for ICOM.

That's it, KA0JRQ's tech files...

I own a plain-vanilla Bearcat 100 (not 100xl) and have had it
for quite some time now with no real major problems. However, I live
real close to our local airport and wouldn't mind receiving the
aircraft bands. Has anyone had any luck in possibly altering the
scanner to cover these bands? I've seen the ads for downconversion
boxes, but didn't want to invest that kind of money. Please
understand that I have no idea how difficult this may be, but if it
can or can't be done I wouldn't mind learning more about the scanner
internals....

Thanks in advance,
David Harpe

qst de k9eui
hr propagation forecast bulletin nr 10 from arrl headquarters
newington ct march 10, 1986
to all radio amateurs bt

in the past two days, areas of the sun responsible for the february flux peak of 103, and the major geomagnetic disturbance of the 7th, were facing the earth again. the first of the two sunspot groups seen in february came back on schedule in early march, producing a flux peak of 93 on march

4, and a strong magnetic disturbance on the 7th. the other group which brought a secondary flux peak of 99 on february 10 has not returned to view, and flux values are running about ten percent below the february figures.

the flux now appears headed for near minimum levels before the middle of march, with no major geomagnetic disturbances likely this week. with the flux currently in the middle 80s, the 21, 24 and 28 mhz bands are doing fairly well, though activity is moving towards mostly transequatorial coverage, and this becoming more brief as the flux moves lower. the dx potential of the 14 mhz band is also falling again. no reversal of this trend is likely before the last week of march. the prediction charts printed monthly in qst now become more useful as they are based on near minimum solar flux levels. seasonal propagation changes related to the increased hours of daylight in the northern hemisphere will also become increasingly noticeable. this seasonal factor is also apparent in the appearance of the qst charts.

american sunspot numbers for february 27 through march 5 were between 6 and 25 with a mean of 16.9. the monthly means for january and february were 1.84 and 18.75 respectively ar

This current sunspot peak has netted me a few interesting catches
at 0200Z plus/minus 15 minutes the past two nights from San Diego.

UI8OAE on 14.025

BY5RA on 14.010

UM8MFB on 14.215 SSB

UA9YE on 14.190 SSB (Zone 18)

AP2MQ on 14.175 SSB

Two goodies "got away" but were working west coast stations:

VU2CK on 14.181

UJ8SAD on 14.170

Really excellent openings! I worked the above with a barefoot
transceiver and a 3-el. tribander at about 30 feet.

Moral of the story--give a listen on 20 at your local sunset the next
couple of days!

73--Jim, K6ZH

P.S. Thanks to all of you who requested a copy of the "sunspots of
the future" article--it'll be in the mail (and I mean U.S. Mail in
this case) by the end of the week.

One problem is that aviation radio is AM not FM like nearly everything
else that the scanner handles.

Years ago when I was in a college dorm, my two roommates (both hams too)
and I loaded the dorm's rain gutters and downspouts as our antenna. We
placed a small wood block under each downspout to insulate it from the
metal (ground) pipe underneath. Then, we ran a very small enameled wire
(#28 or so) through a hole in the screen out and under a sheet metal
screw in the nearby downspout. Using an antenna tuner and an old HW100
we worked most of W. Va. with a signal as good as most mobile stations.
Admittedly, most of the junctions operated as diodes and perhaps we
generated TVI but no TVs were allowed in the dorm and there were no
houses nearby.

73, Jim ky2d.

p.s. net.ham-radio.packet is for packet radio related discussions;

From: JFLASKA
To: Amsat
Subj: IIIC Status #3

The Amsat DL team of DJ5KQ, Werner Haas and DK1YQ, Hanspeter Kuhlen wpent the weekend at the Amsat lab in Golden, Colorado. Purpose of their trip was to exchange information, particularly for the Rudak experiment, as well as other matters. DK1YQ also met Sunday with a Tapr representative. 16mm and photo documentation of the construction activities andw the team will return to Germany on 3 March.

The RF Power Amplifier module will be slightly larger than projected. As a result the mounting points on the stringers are no longer valid, and new ones are being made to accomodate the changed dimensions.

The Arm Safe Plug has been prewired and is installed.

The Export License Application forms were not received by W3GEY prior to the weekend. The originals are complete and the entire file with all needed copies will be in his hands in a couple of days.

The Main Battery Pack was wired and the battery case was assembled and closed. The main battery is now mounted in the spacecraft, but will likely be removed one more time to allow installation of the last mounting screw for the fuel tank.

No progress was made on mounting the Helium Bottle Bracket. That awaits the manufacture of additional mounting parts. An alternative mounting plan has been decided upon.

A milestone of sorts has been achieved. The Main Fuel Tank has been mounted and all mounting ascrews except one have been installed. That will require temporary removal of the main battery as noted above. The fit of the Main Tank was unusually good and the installation was relatively routine. The reaction from W3GEY was "somethingmust be wrong...that was too easy". Those familiar with the build of the two prior Phase III satellites will

remember that the nylon spacers which mount between the tank and the center core of the spacecraft had to be of various different thickness. In the present instance all the nylon spacers are identical.

The Thermal-Vac schedule remains unchanged. Presently a feed through connector for the Vacuun chamber is being sought and hopefully will be promptly located. There is at least a chance that the Vibration test may also be done at the Martin-Marietta facility. That question is presently undecided.

Again, as in the past, the contents of this report should be made available to Packet and Bulletin Board systems.
More next week.

WB0RLY

Posted: Mon Mar 10, 1986 1:14 AM GMT Msg: AGIG-2414-3346
From: JFLASKA
To: AMSAT
Subj: IIIC STATUS #4

IIIC Status #4 9 March 1986

Since our Project Manager, W3GEY, was out of the country this weekend construction activities were under the leadership of W8FAR, Hal Hebert, who has been acting as Construction Manager for the last several months at the Amsat lab in Golden, Colo.

On our Wednesday evening net W3GEY made several announcements that may be of profound importance. The first was that based on reports from usually reliable sources our launch date may have slipped by a month . This is unconfirmed, but is passed along for whatever it may be worth.

The second announcement was a good one. Martin-Marietta has reportedly given us clearance to radiate from the Thermal-Vac unit during the 2 week test now scheduled to begin 23 May, 1986. The decision has not yet been made as to whether the transponders will be turned on during the test, but those of us in the Denver area may have the opportunity to work IIIC during that time. Final decision on this awaits the pleasure of Amsat USA and Amsat DL.

The revised mounting stringers to accomodate the enlarged dimension power amplifier have been completed and await the anodizing process. Fit checks with the revised Amplifier module template were satisfactory today.

The Rudak connector in the wiring harness was changed in accordance with the request of DK1YQ, Hanspeter Kuhlen, and is ready.

Two of the three 2M antenna boxes were installed. The third awaits the installation of other parts. These are for the reflector

elements of the 2M antenna system.

The Torque magnets are installed. These consist of rod magnets in the upper and lower parts of each arm. In addition, the mounting rings, which join these magnets are installed for both the upper, as well as the lower units. While this had been predicted to be a knuckle-skinner, and plenty of bandaids were on hand, it turned out not to be much of a problem. This system is used to control, and change, the attitude of the spacecraft.

The Export License Application forms were delivered to W3GEY prior to his leaving on his trip, and should have been delivered to Amsat Headquarters before he departed these friendly shores enroute to UK.

Copy the next report next week. We're told that this info is getting on packet systems and that the reaction is favorable. Our only purpose is to keep Amsat members informed of what is going on with their satellite.

I must register my extreme objection to the posting of advertisements in this forum. I advise use of net.forsale (na.forsale, fl.forsale) rather than this forum.

I fear that if we start permitting advertisements (most of which will, for most readers, be for items far far away) we will find that the information-bearing articles are buried under the advertising.

Sometime in the 1950's or 1960's there was a novel written which had
ham radio in it. It was written for a teen age to pre-teen age audiance.

Unfortunately I can't remember the title or author. I only remember that
one of the charactors was Randy Morrow who was interested in learning to
become a radio ham and another charactor was Chip Morton or it may have
be Morson??? Chip was allready a ham when the story began and he was a
bit unfriendly to Randy but opened up and help Randy get his
novice license as the story went on. A third charactor was Dave something
- - maybee Schefield - - who worked at a TV station.

If anyone out there remembers anything about that book, I would very much
appreciate it if they let me know!

Thank you very much in advance!!

Very early this morning (like 1100Z) I worked T21ZK on 7001. He's
on Tuvalo, a rock in the Pacific near the date line/equator. According
to the oldest logbooks I have around, this was VR8 before it was T2.
The question is: back when the world was flat, was this place known
as something more familiar--like Gilbert Island, or some such? It
appears to be a new one for me, but I've got DX cards from over 20
years of operating and I'm not sure how to sort this one out.

Also I need his QSL info. The newest Callbook only shows T2AXX type
calls, none with a ZK in them.

Thanks in advance for any help. 73--Jim, K6ZH.

P.S. The sunspot info is "in the mail" for those who requested it.

Version 11.2 of the W0RLI MailBox/Gateway has been released. The
binaries and documentation are in PAKT112A.LBR and the sources are in

PAKT112B.LBR. These are now available from SIMTEL20 as:

```
Filename          Type  Bytes    CRC

Directory PD:<CPM.PACKET>
PAKT112A.LBR.1              BINARY   108800  5FC0H
PAKT112B.LBR.1              BINARY   145280  75A4H
```

The changes since the last such posting, version 10.0, are summarized
below in an extract from the CHANGES.TNC file.

For those who have not seen this system before, a brief description:

The W0RLI MailBox and GateWay is a system which runs on a Xerox 820
computer and which operates on Amateur Packet Radio via one or two
TAPR TNCs (or clones). It also runs with TNC-2s (W3IWI is running one).

The W0RLI system is running at over 75 sites in some number of
countries and makes up the majority of the packet mail forwarding
system. It is also used for gatewaying between local packet areas and
long haul links on HF, or to nearby nets on other VHF/UHF bands.
For a more complete description, see NOTES.TNC.

Hank is not on ARPANET or Usenet. I will be glad to relay comments
and questions to him. If you want the distribution on disk, send
a self-addressed stamped 8" SSSD disk (in re-usable mailer) to Hank at
his callbook address. Two disks if you want the sources as well.
To reduce the load on Hank, I will do the same under the same conditions.
I am also good in the Callbook.

73,
Bob, K1BC

ARPANET: CLEMENTS@BBN
Usenet: {ihnp4, decvax, linus, ...}!bbncca!clements

[Extract of CHANGES.TNC follows]

     W0RLI MailBox and GateWay   Version 11.2

     Changes and additions since version 11.1 are:

Added DE (Display Excluded users).
Added KF (Kill all forwarded).
Added KM (Kill Mine) command.
Added LF (list forwarded), LY (list read).
Added P5 Y / P5 N (enable/disable kill after forward).
Moved help and info text out of config, freeing some memory.
Added $V, print changable parameter values.

     Changes and additions since version 11.0 are:

No msg of day, very short menu for connect by bbs.

     Changes and additions since version 10.7 are:

Added DB - display users maked as BBS.
Added commands to set "allow only bbs" flags from menu:
"P3 Y" or "P3 N" for COMM, P4 same for PRINTER.
Added "allow bbs only" for COMM and PRINTER port.
Added "is a bbs" tag in user record.
Added login count to user record.
GateWay connect to linked station now connects to distant
GateWay, then brings up GateWay and connects to user.
(This is NOT layer 3 ...)

Added "P <call>" - show path to user.
Better command dispatcher.

     Changes and additions since version 10.6 are:

Added DL, DS - display local and sysop users.
Removed "call back" "is bbs" "mail drop" from user record.
Beacon got non-local calls, fixed.
Corrected error detection on S and M commands.

     Changes and additions since version 10.5 are:

Added log file buffering.
Added WA, WN, WS, AN, AS commands for file management.
Added "N" command, user set own name.
Removed extra writes of mail file header.
W now lists $sys files if SYSOP.
M command now parses @ and < correctly.
Download of $sys files not allowed.
Parallel printer code from k4nta into cbios.mac
Addition of "B" command to GateWay menu.

     Changes and additions since version 10.4 are:

Fix "EF" crash on insert of blank line.
Addition of M command in gateway mode.

     Changes and additions since version 10.2 are:

New user record not written until exit. Bad data if gate used.
Addition of "EF" simple file editor.
Bug fix, P1, P2 trashed "illegal call" flag.
Beacon line now not show calls with msgs that will forward.
V now gives "*** Done" when it finishes.
Corrected handling of DEL for BS.
Change to CBIOS.COM to do xon/xoff flow control.
Fixed wrong msg # in svc msg text.

     Changes and additions since version 10.0 are:

Service msg was not logged correctly.
Added RM command: "Read Mine".
Added k1bc's "P" command.
Added optional call and I qualifier to X command.
FWD.TNC parsing now ignores leading blanks, all text after call.
Added MAIL.BAK and USER.BAK to configuration file. Can specify drive.
Fixed loss of timeout if con req during disconnect sequence.
Treat DEL same as BS from TNC.
Added V command: copy file.
Added logging for local user functions, switch in config to turn off.
Call with all blanks hung system at connect. Fixed.
Allow all legal file name chars.
Zero digi allowed NO connects, fixed.
Seperate "max digi counts" for each port.
Max calls in "unread mail" list in config.tnc.

Hr ARRL Bulletin Nr 19 From ARRL Headquarters
Newington CT March 14, 1986, Edited by K1BC
To All Radio Amateurs BT

VHF packet radio got a big boost today. At ARRL request, the FCC
suspended parts of its rules to permit third party traffic by packet
stations under automatic control. Several conditions are attached to
the waiver. Provisions of Sec 97.80(b) and 97.114(b)4, which were both
to be added to the rules March 14, are waived to permit Amateur
stations retransmitting digital packet radio communications on 50 MHz
and higher bands using AX.25 or compatible protocol to be operated
under automatic control while retransmitting third party traffic.

This waiver applies only to the retransmission of third party traffic

originated at another Amateur station which is under local or remote control. When an Amateur station is operated under automatic control, devices must be installed and procedures must be implemented which will ensure compliance with the rules when the control operator is not present at the control point of the Amateur station. This waiver will remain in effect until the Commission takes final action on the petitions for reconsideration filed in PR Docket 85 105.

Amateur packet operators must be alert to the increased dependency upon them for monitoring during the period of this waiver. They should immediately make known to the responsible control operator of an automatic packet station any misuse of his station so the licensee can take corrective action. In summary, VHF packet radio may continue under automatic control. AR

Hr DX Bulletin Nr 11 From ARRL Headquarters
Newington CT March 14, 1986, Edited by K1BC
To All Radio Amateurs BT

Thanks to KB1BE and the Connecticut DX Association for the following DX information.

DXCC desk. Thanks to further information received, DJ5RT/TT8 will now be credited for DXCC, effective April 1.

Zambia. 9J2LC marks the last stop on their African DX tour for Lloyd and Iris Colvin. Look for them on 20 meter SSB and 20 and 40 meter CW. QSL all contacts on the African tour via the YASME Foundation.

Tonga. A35ZK is being operated by Kazu, JJ1TZK. This operation will be followed by T21ZK on Tuvalu, then by a T32 on Eastern Kiribati. Operation is primarily on 20 and 40 meter CW, with some 15 and 20 meter SSB. QSL to JJ1TZK.

Svalbard. JW5E, Tom, is active on 20 meter SSB. QSL via LA5NM.

Falkland Islands. VP8LP, Bob, is active on 20 meter SSB around 2300Z near 14208 KHz. QSL via G3VPW.

Guinea Bissau. J52UAH, Pierre, is active on 20 meter SSB and CW. QSL via F6FNU.

Greece. SV1SL, Giorgio, has been worked on 3790 KHz at 0410Z.

Faroe Islands. OY5NS has been worked on 3793 KHz at 0100Z. QSL via W3HNK.

China. BY1QH, Yuan, in Beijing has been extremely active on 20 meter SSB between 2330 and 0145Z on 14226.5 KHz. This has been a very regular station on the W7PHO DX net at this time, operating four or five nights each week.

Tokelaus. Ron, ZL1AMO, is expected to operate ZK3RW very shortly. Operation is expected to be on 20 and 40 METER cw with some 15 and 20 METER Ssb.

fernando De NORONHA. PY7PO/py0f is active between 2200 and 2300Z on 20 meter SSB and has been reported on 75 meter SSB. PY0FG has been worked on 75 meter SSB at 0115Z. QSL to PT7AZ.

Lerins Island. Four French Amateurs will activate F9ER/P on SSB and F6HMJ/P on CW on April 19 and 20. SSB frequencies will be 3780, 7085, 14180, 21315 and 28510 KHz, CW frequencies will be 10 KHz above the band edge.

Uganda. DJ5RT will be active as 5X5WR on all bands by March 17. AR

I would prefer to broadcast on 80 or 40 meter, although I know this seems
improbable.

In article <143@ky2d-2.UUCP> jak@ky2d-2.UUCP (Jim kutsch) writes:
>Years ago when I was in a college dorm, my two roommates (both hams too)
>and I loaded the dorm's rain gutters and downspouts as our antenna. We
>placed a small wood block under each downspout to insulate it from the
>metal (ground) pipe underneath. Then, we ran a very small enameled wire
>(#28 or so) through a hole in the screen out and under a sheet metal
>screw in the nearby downspout. Using an antenna tuner and an old HW100
>we worked most of W. Va. with a signal as good as most mobile stations.
>Admittedly, most of the junctions operated as diodes and perhaps we
>generated TVI but no TVs were allowed in the dorm and there were no
>houses nearby.

Here at Tech, many of the dorms have bunk beds with metal frames. It
turns out that if you remove the bottom bunk and place it on the floor
or on top of the wardrobes, that the frame with the top bunk remains
pretty stable and resonates pretty close to 6M. With a little tuning,
it works pretty well, and you can put a desk underneath it. At one point,
I had almost 100W going through the bed (not while my roommate was sleeping,
of course).

x
From the March 11, 1986 issue of the New York Times:

Cordless Phones Raise
An Eavesdropping Issue

By Joseph F. Sullivan

"TRENTON, March 10 - Cordless telephones are at the cen-

ter of a debate in the New Jersey Division of Criminal Justice over whether current wiretap laws apply to the interception of conversations pulled out of the air."

"Last December someone recorded hours of conversations that George Spanos, a Republican newly elected to the Plainsboro Township Committee ...., had over his cordless telephone with two political associates...."

"Mr. Spanos, who works for the New Jersey Office of Telecommunications and Information Systems at state police headquarters...said he was shocked when he learned his private conversations were being recorded....."

"...[the tapes eventually] found their way to Donald R. Belsole, the director of the Division of Criminal Justice. Mr. Belsole said the tapes might form the basis for criminal charges. But first, he said, he and his staff have to agree on whether the state's wiretap statutes apply."

"Mr. Cantu, who received the tapes of Mr. Spano's conversations from an intermediary, said he believed they had been made by a ham radio operator...."

"Mr. Belsole agreed that the state wiretap statues.....would cover the situation, but he said that other lawyers in his office disagreed. He asked for a report from his staff."

"Enis Coleman [of the FCC], said FCC regulations adopted in 1935 and updated last year to cover cable communications banned the unauthorized interception and use of any licensed transmission and carried penalties of up to two years in prison and a $10,000 fine."

"'The problem with cordless telephones is so new that we haven't had time to get into court with it,' Mr. Coleman said, 'but I expect that in the future we will'."

"....a lawyer who represents Mr. Cantu said the proper application of wiretap laws to the Plainsboro case was unclear. He said he had found only two state court cases involving cordless telephones - in Kansas and Rhode Island. In those cases, he said, the courts had admitted evidence obtained through the recording of conversations over cordless telephones."

"However, he said he had found a Federal District Court ruling that took the opposite position and suppressed the evidence obtained in this way. The court held, he said,

that conversations over a cordless telephone were the same
as those over a closed system and came under 'wire commun-
ications.'"

Subj: IIIC STATUS #5

IIIC Status #5 16 March 1986

Today was a good visiting day at the Amsat lab. Greg Barr, Administrator of the L5 Society and Jill Steele, President of the Colorado Front Range Chapter of the L5 society were our guests. The members of the construction team were delighted to welcome them and to provide a running narrative on what was being done. Also, WB5PMR, Al and family, visited the lab enroute to a vacation in the High Country. On 20 March we're expecting KA0OOQ, Gerry, for a short visit, and on 23 March, W8GUS, Ron, is expected to be with us. The Colorado group welcomes all who might be interested in the IIIC project. Should you be in the Denver area in the next 8-10 weeks and desire a tour, you can call W3GEY at 530-9340 or the writer at 238-3274 and we'll do our best to oblige. The area code is 303.

Latest word on the Mode S transponder is optimistic. The electronics design and bread-boarding is going well. The final amplifier design has been completed by N6CA, Chip Angle, and the amplifier is presently undergoing tests. While still slightly behind schedule,

the Mode S transponder has a good chance of being completed on time. The box, or enclosure, for the transponder is in process of manufacture locally.

The Main Wiring Harness was installed today. While the installation was a loose one, everything seemed to be nominal. The Wiring Harness Plug brackets for the solar cells were mounted in all 3 arms.

W3GEY, Jan will be in the Washington area all of the coming week. He has with him the design drawings for the oversize mounting stringers for the IHU in arm 3. These were described earlier as being needed to resolve a space problem in mounting the Helium Bottle Bracket. We expect these parts by next weekend.

We're advised the Kick Motor Mounting Brackets are enroute from Amsat DL. Additionaly, parts for the Rudak Experiment will be sent to Germany on 17 March from local inventory.

Machine Shop work is being done on the lower ring of the Helium Bottle Bracket. As previously indicated, a fix for this problem is decided on and no further problem should be experienced in this area.

Thanks to all who have relayed this info via packet systems. W3GEY reports that these updates are on one of the UoSat satellites.

More next week.

73, WB0RLY

73s...Dave.

Since most radio equipment can be shipped, I see no reason not to. Personally, I enjoy reading
these ads, it gives me an idea of what stuff is worth.

qst de k9eui
hr arrl bulletin nr 19 from arrl headquarters
newington ct march 14, 1986
to all radio amateurs bt

amateur radio got a big boost today. at arrl request, the fcc suspended part of its rules to permit third party traffic by packet stations under automatic control. several conditions are attached to the waiver. provisions of sec 97.80 b and 97.114 b 4, which were both to be added to the rules march 14, are waived to permit amateur stations retransmitting digital packet radio communications on 50 mhz and higher bands using ax.25 or compatible protocall to be operated under automatic control while transmitting third party traffic. this waiver applies only to the retransmission of third party traffic originated at another amateur station which is under local or remote control.

when an amateur station is operated under automatic control, devices must be installed and procedures must be implemented which will ensure compliance with the rules when the control operator is not present at the control point of the amateur station. the waiver will remain in effect until the commission takes final action on the petitions for reconsideration filed in pr docket 85 105. amateur packet operators must be alert to the increased dependency upon them for monitoring during the period of this waiver. they should immediately make known to the responsible control operator of an automatic packet station any misuse of his station so the licensee can take corrective action. in summary, vhf packet radio may continue under automatic control. ar

I'm in the process of adding telephone capabilities (autopatch) to the UHF ham repeater I am working on. I would like to be able to detect the ringing current produced by an incoming call. What I need is a CMOS compatible signal indicating that ringing current is present on the drop. That is, a pulse for every ring burst.

I would like to have as much isolation from the drop as possible and have been considering optoisolators to connect the logic to the line.

I would like to get a consensus on your favortie ring current detector. Please mail or post responses. Thanks much.

Paul,

It's a whole lot easier to get on HF with the Kantronics than
any of the others. You have to do a hardware revision to do it with any
of the TAPR work-a-likes. With the Kantronics, all you do is a keyboard
entry.

Chuck...

I havent been very active on HF of late, but what you are describing
    seems very normal to me. When 15 is good, its open well into
    the evening. In recent months, 15 has been very dead, with most
    activity gone by late afternoon. When solar conditions happen to
    be good for a day, its easy to believe 15 stayed open longer.
    Reading the propogation reports, it seems that we have had several
    days with reasonable solar flux in the last month or so.

"This net" is gatewayed to the ARPANet which is taxpayer-supported.
Posting advertisements, especially from commercial businesses, could
jeaopardize this connection.

"Want" ads, which ask for a source of equipment, software, etc., are OK
but should not be replied to by the vendor on the net. Or so is my
understanding.

There is ALWAYS A WAY.

My dormitory antenna, lo those many years ago, was a piece of about 100 feet of #22 enameled wire from the dorm to a tall pine tree. I used the standard shirt buttons for insulators and a simple PI network in the transmitter to match it. I worked all over the eastern half of the US on 80 meter CW with 3 watts. Incidentally, the transmitter was made by rewiring an old AM broadcast receiver that somebody threw out. The audio output stage became the final, and the other tubes served as oscillator, cathode follower, driver etc.

Gawsh what fun compared to today's era of plug it in and if it doesn't seem to work, send it back to the factory (when probably all that was needed was to read the manual).

-John S., W3IKG

My advice: Get an antenna tuner and tune up whatever wire you can put up or connect to! (But don't get ANYWHERE NEAR the power lines!!!!!!!!!!!!!!!!!)

When I was about 7, casting about for something to read, my father said, "Go up in the attic and find the box of old PE's and bring it here. See the "Carl & Jerry" stories? Read them." So I did. At first I didn't understand the electronics part, but they were fun stories anyway (at least the early ones; the later (college era) stories tended to be about yucky girls). After I had gone through the entire batch (ten years' worth) I was starting to understand some of the electronics part, so I read them again.

And again. Then I started reading the Carl Kohler stories, Transistor Topics, and what have you. Then I started reading the whole magazines. And again. And again. I learned an awful lot that way, which served me in good stead at MIT and continues to serve me now.

Does anyone know where John T. Frye is now? Did he ever publish anything other than Carl & Jerry?

qst de k9eui
hr propagation forecast bulletin nr 7 from arrl headquarters
newington ct february 17, 1986
to all radio amateurs bt

from january 26 to february 16 the solar flux was higher than at the same point in the previous solar rotation. over the first 15 days of february the solar flux was never below 82, and it was 90 or higher for 10 days beginning february 2. not since june 1984 have we seen numbers like these, and for comparable conditions on our dx frequencies we would have to look back even farther.

also exceptional was the intensity of geomagnetic disturbances of february 8 and 9. the writer cannot recall hearing wwv k indices of 8 and 9 before, in 12 years of daily monitoring. the february 8 a index of 110 is exceeded only once in our records.

as evidence piles up it seems that few auroras, if any, have had such impact on the world above 50 mhz. users of 432 mhz, particularly, marveled at the strength, quality and geographical coverage, though it must be remembered that uhf stations and techniques have improved markedly in recent years.

the two fairly impressive sunspot groups involved have now gone around the west limb of the sun and we can expect flux values in the low 70s and high 60s until almost the end of the month. it will be interesting to see if these active areas return in early march, when their part of the suns (surface) will be facing the earth again. the author is not betting on it.

american sunspot numbers for february 6 through 12 were between 21 and 46 with a mean of 33 ar

qst de k9eui
hr arrl bulletin nr 13a from arrl headquarters
newington ct february 13, 1986
to all radio amateurs bt

the (fcc) has initiated a rulemaking proceeding, docket 86 63, to determine whether examination credit should be given for written elements for amateur radio operator examinations coordinated by volunteer examiner coordinators, vecs, under subpart i of part 97 of the rules. this action was taken in response to a petition for rulemaking filed by lebert a. scupp. at present, credit can be given only for telegraphy examination elements.

the commission also enquired whether it is necessary to continue to require the filing of an application for a license (at the) time a person takes an examination. the possibilities for expanding the use of the certificate of successful completion of an examination will also be explored.

comments are due by april 30, 1986, reply comments by may 31,

1986.

details will appear in qst ar

Check the latest (40th, 1986 issue) of the World Radio TV Handbook; many
libraries get this, and it might be findable in bookstores since it is
now distributed in the US by Billboard. In the back is a section of
equipment reviews, and a nice feature this year is a short column of
Larry Magne's detailing the "best" and "worst" of SWL equipment. One
category covered is active antennas. It will help steer you away from
buying any really bad units (I believe, working from memory, that the
Grove active antenna was one of the worst...)

Will

A section in the Foriegn Call Book lists the DX QSL bureaus. Most of these
bureaus are accessed by the ARRL QSL bureau . Stations listing other
foreign stations as managers can be sent via the bureau under the managers
call however, to assure a return card, I would definitely send it direct
to the manager with the appropriate number of IRCs / Postage stamps (their
country's stamps) or if it is not a Communist controlled country, a green
stamp ($1.00 USA) with a "self addressed envelop" (incl. USA) will do the job.
The green stamp is usually cheaper but the USA $ is illegal in some countries.

If you are not sure of the country's policy regarding USA monies, send
IRC's. These can be purchased from dx station managers at a reduced price
of that required by the postal service. The number of required IRC's per
a given location is given in the Foreign Call Book but in some locations,
the number of required IRC's listed is high. Most managers will return
any unused IRCs so use the book's information to assure sufficient postage.
PLEASE KEEP IN MIND::::
A QSL manager is a volunteer so make it easy for him and you will get
your qsl. Good luck!! ES GD DXing   RICH KN9K

P.S. All USSR QSL mail goes to Box 88, Moscow and I use the ARRL QSL
     bureau for these cards. Don't expect a quick reply. I still

am receiving USSR qsls 3 years back. Also be sure to contact
your "voluntary" qsl manager in your area and supply him with
the necessary items. Your manager's address can be found in
certain issues of QST.

Summary: The FCC is "selling the park"

As I recall, AT&T attempted to get the FCC to outlaw phone patches
on the basis that the established common carrier was loosing
the revenue from the long distance connection.

A citation such as this does not necessarily mean that the final
word has been given, but it is not a good sign. It seems like
the FCC has taken a profound change in it's role as protector of
a public commodity. The emphasis seems to be on commercialization
of the "Ether" (tells you how long I've been a ham).

I personally see this as being identical to selling national park
land.

Of course, when looking at the "Mobile Homes" in the national parks,
and the "Store Bought Ham Gear" in some ham shacks, I wonder if these
actions are not justified. The last "Home Brew" rig I built wouldn't
be usable today (no FCC certification). As for "advancing the state
of the art", except for a few "advancements" in the digital communications
fields, the last big contributions of ham radio were "SSB", and "SSTV".

I keep wondering how long it will be before "CB" bbs's start showing
up.

If we don't use it, we'll loose it.

Summary: Guild by association, circumstantial evidence, redundancy, overkill.

I read this article with great concern. I may be wrong but the
last time reception of a signal was illegal was WWII. Many Japanese
Americans were put in prison camps as spies for simply owning a radio.

Commercial carriers (broadcast and telecomm) have now been given permission
to scramble their transmissions. This should be enough to discourage any
but the professional evesdropper. The professional evesdropper will either
use the information (sell it to a competitor) in such a way that it will
be difficult to trace, or be caught because of evidence other than
ownership of the reciever and/or decoding mechanism.

It reminds me of the man convicted of moonshining because he owned a still.
the man asked; "you mean I'm guilty because I had the equipment?",
the judge said "yes, that's right"
the man said "then you might as well convict me of rape as well!!!"
the judge said "you mean you've raped some one?"
the man said "No, but I've sure got the equipment".

It was mentioned on a nationally broadcast radio show, that you could
call a cable operator in another city (or even state) and get the
appropriate codes for a DES type tvro decoder, in exchange for your VISA
card number. This was highly reccomended, because one particular
city charged a fee that was less than half the price of our local
cable company.

In New York, it is illegal to connect a decoder to the cable circuit.
In fact, if you connect a "cable ready" VCR and a "cable ready" television
to a "Y" adapter, you can be fined or imprisoned. I can understand the
cable company getting upset if you "tap in" without paying anything, but
paying double for the same cable seems a bit unreasonable. The fee
is $5/month per connection plus $5/month for a "Cable company decoder"
plus $N/month for each "premium channel" you wish to recieve.

I support encryption of commercial signals, particularly the "per program"
options, because it exempts the broadcaster from liability and censorship
problems. A "premium channel" can show R and X rated movies and if someone
complains, they had to have either paid for the priviledge of watching or
used an unauthorized descrambler.

HR 3378 ensures the broadcaster that he is exempt from liability for
broadcasting a potentially offensive signal, that should be the
goal of this bill. Instead, it has made the reciever liable for
owning decoding equipment.

By the way, use of any survaillence equipment, in including acoustical
"Big Ears" and optical telescopes, for the purpose of invasion of privacy
is already covered by other state and federal laws. The most difficult
part of enforcing this is proof that privacy was invaded. If a contracter
outbids you by using ANY surveillance device, optical, acoustical, or
electronic, there is still the problem of proving that serveilance was
used, caused you damages, and was done for the explicit purpose of
invading your privacy. In a civil case, where only a "preponderance
of the evidence" is required, there is a remote chance of winning the
case. In a criminal case, where there can be "no reasonable doubt"
of all these facts, the chances of conviction are very slim.

Interesting point: In Colorado, they stopped issuing "private investigators"
liscences. The legislatures decided that the state could not grant anyone
the right to invade another person's privacy, reguardless of how it was done.

The following message may be of interest to those of you who are concerned
about FCC 85-105, what you can do, what the ARRL is doing, etc.
              = = = = = = = = = = = = = = = = =
9953 PY 5749 K1BC   K1OJH   860220 more on FCC rules
At K1OJH :   197 From K1OJH Rcvd 860219/0200, Sent 860219/1931
Date: Feb. 18, 1986
  To: NEPRA SYSOPs
From: Dick Eastman
Subj: New FCC Regs

Just a note to let you know what I've been up to. In addition to
the various bits and pieces of messages that I have been
forwarding to you, I have also been talking with Perry Williams
at the ARRL. Perry is the person at the League who deals
primarily with the FCC. He did tell me a few things that have
been going on recently.

First of all, the FCC monitoring station in Maine that has been
getting all the publicity recently has not yet issued any
citations. They have called (at least) two SYSOPs that they
suspected might be running unattended H.F. stations. In one case,
they found no licensed Amateur on the premises during time of
operation. That person has not yet received a citation. If he
does get one, it will be for unattended operation below 30 MHz.
This issue is unrelated to the recent regulations issued.
Unattended operation below 30 MHz always has been and will
continue to be a violation of FCC regulations.

As to the new regulations, this is considered to be an "Open
Issue", with several items not yet clearly defined by the FCC.
The FCC's Chief of the Special Services Division (who is the Boss
of the head of the Private Radio Branch which administers Amateur
Radio) visited the ARRL in Newington last Thursday. He was given
a demonstration of packet radio, including traffic handling via
W1AW-4 running W0RLI software and W1AW-5 unattended digipeater.
The Chief was favorably impressed by what he saw and discussed it
at some length in a meeting afterwards. He stated that the FCC
should be encouraging development of Amateur Radio digital
networks.

ARRL President Price and several other reps, including Perry Williams will meet with the head of the FCC's Private Radio Bureau in Washington at the end of this month. At this meeting, the ARRL will suggest new definitions of Amateur communications in a "store and forward" mode versus Third Party Traffic. Both FCC Chiefs have verbally recognized there is a difference and have expressed willingness to consider them seperately. The League is very optimistic on this issue. The regulatory authorities in several European countries already differentiate handling messages on behalf of hams versus non-Amateurs. Hopefully similar logic can be worked into the FCC's regulations.

A second item on the agenda at this meeting will be a discussion of who holds responsibility for "traditional" Third Party Traffic. It is the League's position that the analogy is that of a postcard in the Postal System. It's free and open, anyone in the path may read it, but in most cases will not. The actual responsibility lies with the person who originated the message, not with eag("mailman" along the route. The FCC may or may not agree with this analogy, the League has a bit less optimism on this.

> There is a side issue here that I did not discuss with Perry: namely the rules about plain and unencrypted communications. I really have reservations about the recent developments in sending binary files back and forth. I'm not sure I know all the ramifications of this, but I sure am uneasy about someone loading a binary file onto a PBBS to be pulled later by someone else. In a direct QSO, there would be less of a question. I would sure hate to "muddy the waters" when discussing BBS freedoms with the FCC.

Depending upon the outcome of the ARRL/FCC meeting, the ARRL will file for Reconsideration of the recent rulemaking. Perry Williams also recommends other interested individuals and groups should also file for reconsideration. Calm, well-thought out comments in volume will help. (Unless I hear otherwise from NEPRA's officers, I will also file such a motion in the name of NEPRA.)

What do we do today? Perry very quickly pointed out that no one at the League will recommend that you do or do not continue operating your VHF BBS in unattended mode. He said that in his recent discussions with FCC officials, it is clear to him that the FCC has not finally decided how to handle ham radio "store and forward" QSOs. The recent written rulemaking was very definitive in some ways, yet does not reflect what the various FCC officials are saying in face-to-face conversations.
xD
Perry Williams would not give an "official" League recommendation, but did point out that W1AW-4 and W1AW-5 are remaining in operation in unattended mode. In fact, this unattended VHF BBS was demonstrated to a senior FCC official last~r

Thursday. Perry stated he would be "very surprised" if anyone receives a citation for unattended operation of a BBS above 30 MHz.

What does NEPRA recommend to New England SYSOPs? The conservative viewpoint is to operate only when the SYSOP is seated in front of the screen with his finger on the switch. A more liberal method is "damned the regulations, full speed ahead". I believe the reality is some where in between. The FCC is very interested in unattended operation on H.F., but has paid no attention to VHF operations. Obviously, each of you must decide for yourselves. Probably maintaining a low profile is best. I, for one, am very willing to have an unattended VHF BBS in operation under my call. If I had an H.F. gateway, I'd power the H.F. rig off whenever there wasn't a licensed amateur in the house.

For the future: I (we) should file a Request for Reconsideration with the FCC. Input is hereby solicited. Please pass on your concerns to the traffic handlers using your BBS. The National Traffic System should be heavily involved in this.

To quote that great American philosopher, Yogi Berra: the game ain't over 'till it's over.

- Dick, K1OJH

= = = = = = = = = = = = = = = = =

You may be interested to know that TAPR is filing a strongly worded set of comments with the FCC that are being written at this very minute. Those who are coordinating this activity are NK6K, WA7GXD, WB9FLW, WB6YMH & W3IWI.

Summary: MUCH more to this bill than meets the eye.

I got a copy of the bill (HR3378, S1667) by calling Sen. Leahy's office.

One thing that this bill does is legalizes the use of "tracking devices" by law enforcement people, after getting a court order. It puts various restrictions on their use, but basically says that if the cops want to put a bug on your car, person, clothes, or whatever, they are likely to be able to find a legal way to do it. Furthermore, they can plant the device *before* obtaining a court order, as long as they take it away "when the information sought is obtained, or when the application for the [court] order is denied". They have 48 hours to file the application for the court order, i.e. they can track you for 2 days without breaking the law and without getting a court's permission. If they find out what they need to know, they can remove the bug and no harm done. RIIIIIIIIIIIIIIIGHT!

It treats this kind of bug as almost equivalent to a "pen register", which is something the phone co. puts on your line to record who you are calling.

The bill also defines "pen register" to include "a device which records and/or decodes electronic or other impulses which identify the numbers dialed *or otherwise transmitted* on the telephone line..." This definition includes any data transmitted on the line, and could be construed to include digitized voice ("numbers").

It makes it legal for the cops to break and enter your house, car, or wherever in order to install a bug or wiretap. It nicely provides that the government may not force someone who operates a communications system to break and enter to plant government bugs. I'm sure the Communications Workers of America are happy to hear it.

It loosens a number of restrictions on actual wiretaps too, including allowing officials below the level of Assistant Attorney General to approve them, expanding the list of suspected crimes that you can wiretap for, and allowing 48 hours instead of "ASAP" for making the recordings available to the judge.

I find all of this utterly repugnant and don't see how it has any place in a "Privacy of private communications" bill.

This bill is being pushed "because somehow we forgot to protect non-voice information going over phone lines". But check Covert Action Information Bulletin #11, December 1980, pg 37: "Our Department of Defense and Department of Justice have been extremely careful in orchestrating the legal definition of 'interception' to *exclude* the acquisition of information of a non-oral nature." (emphasis theirs)

The NSA has been using this loophole for years. I'm sure they aren't
closing it off unless the bill opens another hole at least as big.

I don't know if Congress thought it was legalizing wiretapping of
datacomm when they passed it last time. What are they writing into law
that they don't understand this time? I'm sure that some of the new
wordings and definitions in today's bill will have similar effects.
See net.ham-radio for some of the problems.

Here is what that short "Best and Worst" article in the 1986 WRTH says
about active antennas:

Best: McKay Dymek/Stoner DA-100D
      Also, "almost anything made by Datong" was in the "Best" category.

Worst: Grove ANT-9 (Severe overloading problems)

Will

I would LOVE to hear about mods for RX and TX! Please, if you can,
post the instructions. If you don't want to do that, just leave
me your address and I'll send a SASE or something...

To anyone else: If you know of mods that can be made to the popular
2-meter FM handhelds, I'd really like to hear about them. I am the
Assistant Emergency Coordinator for our city and have members who
want to know how to scan public-service freqs with their HT's.

Any correspondence greatly appreciated!

I'd suggest you take a look at some of the designs W7ZOI published
in the ARRL publication "Solid State Design for the Radio Amateur."
I built up a direct coupled amplifier using four stages and used it
with a homebrew loop antenna to achieve incredible results down on 75 meters.
By turning the loop, you can eliminate local QRN yet still hear as much on the
2' loop indoors as I could on the G5RV outside (wish I could transmit on it!)
HIActive antennas are really only limited by the inherent noise in the amplifier
itself. Do not have any experience with the MFJ or Sony (or Palomar) but I
can tell you that active antennas work - and work well! Good luck es 73

tecNICA is a non-profit organization which sponsors people to visit and work in Nicaragua in their professions or hobbies for 2 or more weeks. Volunteers pay their own airfare, and the sponsoring Nicaraguan agencies pay for the volunteers' room and board during the visit. I have gone to Nicaragua with tecNICA and can personally recommend it as a rewarding cross-cultural experience. The help which you would provide to Nicaragua now would be invaluable during this time of crisis. Knowledge of Spanish is recommended, but not essential.

"Originally conceived as a project to assist Nicaraguans with computer technology, the scope of tecNICA's activity has steadily increased, and now includes engineering, business management, economic planning, building trades, and a wide variety of other fields. The typical delegation getting off the plane in Managua includes people with skills ranging from machine tool design to insurance marketing, and the variety is constantly increasing."

This years' scheduled trips are: March 7-22, April 4-19, May 2-17, May

30 - June 14, June 27 - July 12, August 1-16, September 5-20, October 3-18, November 7-22 and tentatively December 5-19.

Here is a sampling of specialists now needed:

- General computer professionals (especially IBM 370, 4331, 34 series, OS, databases's, and all micros)
- Computer service/repair technicians
- Computer analyst - billing and data acquisition
- Digital logic teachers
- Microprocessor fundamentals teachers
- Two-way radio engineers and technicians
- Data transmission, switching - engineers, technicians
- Telephone engineers and technicians
- Electronic trouble-shooting engineers
- Electrical engineers (power equipment)
- Industrial electrician
- Medical instrumentation/electronics technicians
- Economists, statisticians
- Diesel and automotive technicians
- Public health workers
- Carpenter/cabinet makers/teachers
- Translators, interpretors

tecNICA can be contacted at the following places:

- Berkeley (National Office) 110 Brookside Drive, Berkeley, CA 95705; (415)654-7768
- San Francisco (415)848-0292

[line eater offering]

I'm posting this to both net.jokes and net.ham-radio, mainly
because I haven't read anything about "real life" this funny
in a long time, and it involves hams.

This was taken from the latest issue of the newsletter my ham
club puts out. I can't vouch for it's authenticity, but the
ham who contributed it is a pretty reliable source.

Evidently an insurance company wanted to know the whole story
about one of their claims - I'd say this guy gave them everything
they requested...

Enjoy!

"I am writing in response to your reqest for additional information in
block number three of the accident-reporting form. I put "poor
planning" as the cause of my accident. You said in your letter that I
should explain more fully, and I trust that the following details will
be sufficient. I am an amateur radio operator. On the day of the
accident I was working alone on the top section of my new 80 foot tower,
when I completed my work, I discovered that I had, over the course of
several trips up the tower, brought up about 300 lbs of tools and
spare hardware. Rather than carry the now unneeded tools and material
down by hand, I decided to lower the items down in a small barrel by
using a pulley, which fortunately was attached to the gin pole at the
top of the tower."

"Securing the rope at ground level, I went to the top of the tower and
loaded the tools and materials into the barrel. Then I wentback to the
ground and untied the rope, holding it tightly to ensure a slow descent
of the 300 lbs of tools. You will note in block #11 of the accident-
reporting form that I weigh only 155 lbs."

"Due to my suprise at being jerked off the ground so suddenly, I lost
my presence of mind and forgot to let go of the rope. Needless to say,
I proceeded at a rather rapid rate of speed up the side of the tower.
In the vicinity of the 40 foot level, I met the barrel coming down.
This explains my fractured skull and broken collarbone. Slowed only
slightly, I continued my rapid ascent, not stopping until the fingers
of my right hand were two knuckles deep into the pulley."

"Fortunately, by this time, I had regained my presence of mind and
was able to hold on to the rope in spite of my pain. At approximat-
ely the same time, however, the barrel of tools hit the ground and
the bottom fell out of the barrel. Devoid of the weight of the tools,
the barrel now weighed approximately 20 lbs. I refer you again to my
weight in block #11. As you might imagine, I began a rapid descent

down the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming up, this accounts for the two fractured ankles and the lacerations of my legs and lower body."

"The encounter with the barrel slowed me enough to lessen my injuries when I fell onto the pole of tools and fortunately, only three vertabrae were cracked. I am sorry to report, however, that as I lay there on the tools in pain, unable to stand and watching the empty barrel 80 feet above me...I again lost my presence of mind...I let go of the rope."

Does anyone have any practical experience with the following products:

1) Kantronics UTU-XT and AEA CP-100 terminal units.

> The Kantronics seems to have a more features (built in microprocessor with AMTOR etc.) while the AEA one is a 'plain' RTTY converter (or modem, if you like). The price is roughly the same though; makes one wonder whether the actual 'modem' part of the AEA is so much

better? Also, I would be interested to know whether you can bypass
the internal micro in the UTU-XT (tap the demodulator output directly)
if you want to use your own SW/HW to decode strange speeds, codes,
protocols etc.?

2) Trap slopers.

There is a number of small companies advertising very similarly
looking trap slopers in CQ, 73 etc. Are these any good? Something like
that would suit my limited space very well. I'm becoming active after
a long time again; I need a compact wire antenna to get on the air
in the first place (until I get something better for 20/15/10) and
would be using it on 80/40 permanently (maybe 160). No DX ambitions
for 80, just short-range ragchewing.

3) Butternut HF4B ('Bytterfly')

This is a very compact 'mini-beam' for 20/15/12/10 meters. I realize
that one cannot expect the performance of a full-size six-element
monobander from this one, but it's about maximum that I can put up.
Any experiences? Any other recommendations for a *very* small beam?

FCC certification doesn't apply to homebrew rigs.

Hi Al, I have been reading your postings on here for a few months now
and we weren't able to post news onto the net from Amdahl.
They just turned that feature back on and I thought I'd drop you a line.
If I knew how to send you mail directly I would avoid using the net, but
that is something I haven't figured out yet. What new with you?
I have some things to tell you. Give me a call sometime.

Actually, that accident was taken from a great irish folk-ballad called
"Why Paddy's Not At Work Today" or something like that.

QST DE K9EUI
HR ARRL BULLETIN NR 16 FROM ARRL HEADQUARTERS
NEWINGTON CT FEBRUARY 21, 1986
TO ALL RADIO AMATEURS BT

FCC HAS AMENDED SECTION 97.61A OF THE AMATEUR RULES TO PERMIT
F2A EMISSION IN THE 29.5 TO 29.7 MHZ REPEATER SUBBAND.

ARRL HAD PETITIONED FOR THE AMENDMENT SO THAT F2A EMISSION, THE
PRIMARY MODE USED TO IDENTIFY BY TELEGRAPHY AMATEUR F3E
EMISSION REPEATERS, WOULD BE AVAILABLE IN THE 10 METER REPEATER
SUBBAND.   FCC ALSO EDITORIALLY AMENDED SECTION 97.61A TO SHOW
F2A EMISSION IN OTHER AMATEUR BANDS WHERE REPEATER OPERATION IS
AUTHORIZED.   THE COMMISSION SAID THE AMENDMENT WAS NECESSARY
BECAUSE THE EMISSION DESIGNATOR   F2A   HAD   BEEN   OMITTED

INADVERTENTLY FROM THOSE BANDS WHEN THE PREVIOUS EMISSION
DESIGNATORS WERE CONVERTED TO THE NEW SYSTEM AR

HR ARRL BULLETIN NR 15 FROM ARRL HEADQUARTERS
NEWINGTON CT FEBRUARY 20, 1986
TO ALL RADIO AMATEURS BT

A VERY LARGE RUSSIAN SPACECRAFT CALLED MIR WAS LAUNCHED
FEBRUARY 19. IT WILL BE A MANNED SPACE STATION FORMING THE
CORE OF SOVIET MANNED SPACEFLIGHT FOR THE NEXT SEVERAL YEARS.

A SMALL, MANUALLY DEPLOYED SATELLITE CALLED ISKRA 4 WILL BE ONE
OF THE FIRST HAM IN SPACE ACTIVITIES FROM MIR. PREVIOUS ISKRAS
CONTAINING AMATEUR RADIO EQUIPMENT WERE MANUALLY EJECTED FROM
SALYUT 7.

THE FIRST CREW SHOULD REACH MIR IN THE NEXT WEEK OR SO.
SEVERAL COSMONAUTS ARE LICENSED AMATEURS AND OPERATION FROM MIR
BY THEM IS THOUGHT A LIKELY PROSPECT.

THE 10 METER SIGNALS RECENTLY THOUGHT TO BE FROM RS9 HAVE NOW
BEEN POSITIVELY IDENTIFIED (AS COMING FROM RS1). RS1 CEASED
REGULAR OPERATION IN 1980 BUT COMES TO LIFE OCCASIONALLY WHEN
CONDITIONS ARE RIGHT. RS9 AND 10 ARE NOW SCHEDULED FOR LAUNCH
IN LATE MAY. AR

QST DE K9EUI
HR CRRL BULLETIN NR 6/5 FROM CRRL HEADQUARTERS

LONDON ONT FEBRUARY 24, 1986
TO ALL RADIO AMATEURS BT

DOC HAS INFORMED CRRL THAT, EFFECTIVE APRIL 1, AMATEURS APPLYING FOR A STATION LICENCE, FOR THE FIRST TIME ONLY, WILL HAVE TO PAY A FEE OF 26 DOLLARS. THE FEE WILL DROP TO 20 DOLLARS THE FOLLOWING YEAR. AMATEURS WHO REQUIRE A STATION LICENCE FOR ONLY PART OF A YEAR CAN PAY ON A PRO RATED BASIS. CANDIDATES FOR DOC EXAMINATIONS WILL HAVE TO PAY A 5 DOLLAR FEE FOR EACH PORTION OF AN AMATEUR RADIO EXAMINATION THEY TRY.

CRRL HAS FORMALLY ASKED DOC TO CONTINUE THE PRACTICE OF ISSUING SPECIAL CALLSIGN PREFIXES TO HELP CANADIAN AMATEURS PUBLICIZE SIGNIFICANT EVENTS IN THE LIFE OF THE COUNTRY. THE SUBMISSION PRESENTS A PLAN WHEREBY AMATEURS WOULD ASSIST DOC IN ISSUING THE PREFIXES, KEEPING DOC INVOLVEMENT, AND COSTS, TO A MINIMUM

QST DE K9EUI
HR PROPAGATION FORECAST BULLETIN NR 8 FROM ARRL HEADQUARTERS
NEWINGTON CT FEBRUARY 24, 1986
TO ALL RADIO AMATEURS BT

THE SOLAR FLUX CURVE FOR FEBRUARY IS TAKING ON THE SHAPE OF A SLIGHTLY IRREGULAR SINE WAVE. FROM 84 ON FEBRUARY 1 IT RISES QUICKLY TO 99 ON THE 3RD, PEAKS AT 103 ON THE 5TH, SLIDES TO 95 BY THE 9TH, AND TUMBLES DOWN TO 70 ON THE 17TH. IT HAS BEEN AS LOW AS 67 SINCE, AND AT 69 ON THE 23RD, IT APPEARS READY TO START UPWARD AGAIN.

THE ODDS ARE AGAINST THE FLUX REACHING 103 IN EARLY MARCH, AS

IT DID IN FEBRUARY. THAT FIGURE WAS THE HIGHEST SINCE JULY 1984, AND WE ARE NOW IN WHAT IS PROBABLY THE LAST FULL YEAR OF CYCLE 21. AN APPRECIABLE RISE SHOULD BE UNDERWAY HOWEVER BEFORE NEXT WEEKS BULLETIN.

THE TWO WEEK RUN AT 85 OR HIGHER MADE THE FIRST HALF OF FEBRUARY A VERY INTERESTING TIME ON 21, 24 AND 28 MHZ. NOW THAT WE ARE BACK TO QUIET SUN LEVELS AGAIN, 24 AND 28 MHZ ARE ALMOST DEVOID OF DX, AND 21 MHZ IS ACTIVE MAINLY IN THE LOWER LATITUDES AND ON TRANSEQUATORIAL CIRCUITS. NO MAJOR CHANGE IN THIS PATTERN IS EXPECTED BEFORE ABOUT THE 25TH.

EARLY FEBRUARY WAS MARKED BY THE MOST SEVERE GEOMAGNETIC DISTURBANCES IN SEVERAL YEARS. BECAUSE OF THE 28 DAY MONTH, WE CAN EXPECT RECURRENT MAJOR GEOMAGNETIC EFFECTS ON ABOUT THE SAME DATES IN MARCH. THIS TWO MONTH PATTERN IS APPARENT IN PROPAGATION RECORDS FOR FEBRUARY AND MARCH AS FAR BACK AS THE 1930S. VHF ENTHUSIASTS TAKE NOTE THAT THE SECOND WEEKEND OF MARCH SHOULD BE MARKED IN RED ON YOUR OPERATING SCHEDULE.

WE WERE IN A DISTURBANCE OF MILDER CATEGORY AS THIS BULLETIN WAS BEING PREPARED. IT SHOULD BE OVER BY THE 26TH. THE LAST 2 DAYS OF FEBRUARY AND THE FIRST FEW OF MARCH SHOULD BE OF SLIGHTLY BETTER THAN AVERAGE PROPAGATION ON ALL DX FREQUENCIES.

AMERICAN SUNSPOT NUMBERS FOR FEBRUARY 13 THROUGH 19 WERE BETWEEN 0 AND 20 WITH A MEAN OF 4.9. AR

There is a recording of Gerard Hoffnung reading this at the
Oxford Union, which I highly recommend.
It's at least 25 years old, so it might be hard to find.

A joke? Let's see....

An engineer, a physicist and a mathematician are shown a
room with a long upright tube on the floor, with a ping
pong ball at the bottom, and a pitcher of beer.
The problem is...how to get the ball out?
The engineer empties the beer into the tube, and of course
there's not enough. He breaks the tube to get the ball out.
The physicist empties the beer into the tube, and blows
hard down the side to blow the ball out.
The mathematician drinks the beer and waits......

A joke you say? But it's Monday.

I've used a Dymek DA-100 antenna for a few years, about ten years ago.

Good results on BC and LF, not so good at ten meters.   With the whip
on top of a 20-40' grounded tower, noise pickup was much reduced.
Cross mod from 100 kHz Loran-C was a nuisance, and I've blown three input
fet's over the years. Make sure you get one that isn't potted!

It's been a while since I've experimented with active antennas, but I'd
be tempted to try a source follower with a power fet.

CIRCULATE/
TO: (Group 95)

The following document was filed by TAPR with the FCC on Feb.24 in
response to the recent FCC Report and Order 85-105 pertaining to
automatic control of packet radio systems operating at frequencies
above 50 MHz. The credit for pulling this document together should
go to Harold Price, NK6K with some of the various ideas and comments
```

having been generated by WA7GXD, WB6YMH, W3VS and W3IWI.

73 de Tom, W3IWI

February 24, 1986

Before the
Federal Communications Commission
Washington, DC 20554

In the matter of	)	
Amendment of Part 97 of the	)	PR Docket No. 85-105
Commission's Rules to permit	)	
automatic control of amateur	)	RM-4879
radio stations.	)	

PETITION FOR RECONSIDERATION

Filed by:
Tucson Amateur Packet Radio
P.O. Box 22888
Tucson, Arizona 85734

To the Commission:

Tucson Amateur Packet Radio, a club with international membership consisting of 1400 amateur packet radio enthusiasts which has coordinated the volunteer development of many of the major building blocks of the existing amateur packet network, and whose members have contributed since 1981 in the development of packet radio hardware, software, and operating procedures, hereby submits this petition for reconsideration of the report and order on PR docket No. 85-105. Our comments are limited to activities and operation above 50 MHz, as 85-105 only addresses these frequencies.

Our reasons for requesting a reconsideration are:

1) The inclusion of third-party traffic limitations, given the current definition of third-party traffic, puts severe constraints on the design and utilization of the developing packet radio network.

The questions that arise in the amateur packet community over this issue are mainly semantic ones, caused by attempting to force new technologies to fit the old definitions supplied by 97.3. The FCC has stated both at amateur gatherings and in the comments associated with several recent actions that it is in-

terested in promoting computer assisted amateur communications and what is commonly referred to as Computer-Based-Message-Systems (CBMS), or Bulletin Board Systems (BBS). Bulletin Boards are central repositories of messages sent between two or more parties. The messages are stored for indefinite periods of time on the bulletin board until they have been read by all parties concerned. The messages are seldom sent on behalf of the control operator of the BBS itself, and that's where the third-party rules begin to cloud the issue.

By strict application of the current definition of third party traffic :

> 97.3(v) Third party Traffic. Amateur radio communication by or under the supervision of the control operator at an amateur radio station on behalf of anyone other than the control operator.

A digital BBS system under automatic control could not transmit messages stored on it that are not originated by or destined for the control operator of that BBS. This makes illegal the major purpose of the bulletin board system.

During the early development and on the air testing of packet radio message systems, amateurs have viewed the message relay device as a repeater. A repeater, as defined by 97.3(l), is a device that automatically retransmits the radio signals of other amateur radio stations. Part 97 does not specify a minimum length for the time delay between receipt of the radio signal and its retransmission.

Repeaters, as commonly used, can pass traffic between two amateurs, neither of whom are control operators of the repeater, with out having that traffic defined as third-party. Repeaters have regulatory limitations of their own, however, and the development of more complex message systems and other packet switching devices will soon pass beyond the limits of the current definition of "repeater".

Existing amateur BBS systems are already handling large numbers of messages. Recent statistics reported by east coast stations show counts of more than 1000 messages per month at each of several sites. These systems are developing more sophisticated methods of automatically forwarding messages from site to site.

To review, the language specified by 85-105, makes the BBS function, desired by both the amateur population and the FCC, illegal unless the BBS is classed as a repeater. Imminent developments in packet radio will make this classification invalid for some devices under the current definitions. Therefore, 85-105, while attempting to permit continued experimentation, actually inhibits it.

A fix for this problem could be to include language in part 97 that specifically states that traffic originated by an amateur station on behalf of an amateur and destined for an amateur is not third-party traffic. This would make the permitted activities of automatic control digital devices, serving in a relay capacity but not classified as repeaters under the current definitions, match the permitted activities of classic repeaters. We note that several countries which prohibit third party messages (including West Germany, Norway, Japan and New Zealand) have chosen the interpretation that amateur-to-amateur messages passed thru packet radio BBS networks do not constitute third party traffic.

2) The inclusion of third-party traffic restrictions, for traffic of a character not discussed in 1) above, will severely limit the utility of packet radio networks for public service applications.

The following discussion presumes the acceptance of the above argument, and that the type of third-party traffic discussed is traffic on behalf of someone other than the control operator of the origination or destination station.

The FCC has done much to promote the use of high speed digital communications in the amateur service. The constant growth of experimentation in packet radio began when the use of the ASCII code at speeds of 300 bps and more were permitted. The majority of digital communications currently takes place at 1200 bps. 9600 bps is in limited use now, with 56kbps devices under construction.

A requirement that third-party traffic be monitored at each relay point in the network will limit the speed of the network to that of the reading speed of the slowest control operator. It would probably force the construction of two parallel networks, one at low speed for third-party traffic, and one at high speed for non-third-party traffic. This is undesirable.

The requirement to monitor the traffic at each relay point in the network also places severe constraints on the design and implementation of the network. In most of the networks now under discussion, the message is only guaranteed to appear in its entirety at its entry to the network, and at its exit. While the message is in the network, it is broken into many small pieces. They may be out of sequence as they pass a relay point. Some parts of the message may take a different path through the network.

With such message fragmentation, a control operator at an intermediate relay point may not have sufficient information as to the content of the message being relayed to correctly judge whether the character of the message is that of third-party traffic or not.

On the other hand, TAPR and its members share the FCC's concern over potential abuse of the network by commercial interests. The problem then becomes one of making sure the amateur regulations are followed, while at the same time making it possible to build the network.

We believe that it is possible to meet both of these goals. The key is in treating the packet radio network, consisting of an unspecified number of relay stations, as a "pipe". The pipe has an input and an output. At the entrance and exit to the pipe are non-automated control operators, who are ensuring compliance with the rules. Once a message has been placed in the pipe by a control operator, it need not be rechecked by an operator at each relay point that makes up the pipe. The message is again checked by a control operator at the end of the pipe if it is destined for a third-party. The amateur who was the control operator at the origination point of the message is responsible for ensuring compliance with the rules.

We cite as an example: Assume that a network exists between San Francisco and Los Angeles. There are two parallel paths in this network, one that runs down the coast at 9600 bps on 221.95 MHz, and a second that runs via Sacramento through the central valley. An earthquake simulation is taking place between the Red Cross in San Francisco and the State Office of Emergency Services (OES) in Los Angeles. The Red Cross has entered a series of damage reports and hospital bed estimates into a hand-held computer. There are 40,000 characters of data involved. They hand the computer to an amateur to transmit the data to Los Angeles over the amateur packet network. This is obviously third-party traffic. It is also obviously something that could not have been sent using voice, Morse code, or other slow data rate modes, in less than five hours.

The amateur in San Francisco reviews the data and determines that it meets the amateur rules and regulations. He then, as control operator of a station attached to the entry point of the network, (the pipe), enters the data into the network. It now flows through the pipe toward Los Angeles. Also in the pipe, simultaneously, are perhaps 20 other two way conversations. Monitoring of the messages while in transit through the pipe is difficult to do as it flows at high speed through two different paths. Part of the messages may even be automatically stored on disk at an intermediate point if the Los Angeles end of the network is down or congested. Once the message traffic is in Los Angeles, the control operator of the station at the final destination reviews them before passing them to the third-party.

A question that will certainly be raised at this point is, "Is this actually likely to occur in the near future?" Yes. The predecessor to the network above exists now. There are 5 relay points along the coast between Los Angeles and San Francisco

operating on 145.01 MHz at 1200 baud. There are 4 relay points that go up the central valley on 145.05 MHz at 1200 baud. During an exercise with the State OES, amateurs were handed a disk from an Apple II computer which contained simulated third-party traffic. This traffic was relayed through the network to an attended BBS system in San Francisco where it was stored and later transmitted through a second network to Sacramento. Similar networks and public service drills exist in other areas of the country. Large networks exist in the New England area, the Mid Atlantic States, and in Florida.

The only thing missing between the imaginary scenario and the actual one is higher baud rates and an increased level of automatic control. Both of those elements will be required if the amateur network is to provide a high level of service and reliability in time of need.

To review, we suggest that the network be viewed as a pipe, and that control operators at the input and the output to the pipe are sufficient to ensure compliance with third party traffic regulations.

At no time do we recommend that the third parties themselves be given direct access to the network.

The question of unauthorized, i.e. commercial, access to the network must be discussed. Since the regulations for traditional non-digital repeaters do not require constant monitoring, neither should the elements of a digital network. The only monitoring required for repeaters under automatic control is when third-party traffic is involved, this topic is discussed above. Monitoring does go on, however, in the course of daily amateur activities.

Policing of the amateur frequencies to keep intruders out has always had a great deal of support in the amateur community, and high speed digital communications will be no different. Although the same things that make it hard to monitor third-party traffic "in the pipe" will also affect an intruder watch, the intruder must still use the same pipe input as everyone else. Here, monitoring is easy. In fact, at its simplest level, packet radio is the embodiment of the FCC's underlying requirements for automatic control, "devices must be installed and procedures must be implemented...". The network entry and exit points are rigidly controlled by the protocols inherent in packet radio. Although the particular procedures will change as the network evolves, their attributes will remain the same. The originating and destination station are readily discernible. Activity is easily monitored and tracked by a computer. The devices necessary to do this monitoring will be readily available, since they are the same devices used by the general amateur population for access to the network. The prices of such devices have fallen from 00 to 9.00 in three years as the number of amateurs

using the mode rose from 200 to 14,000.

In summary for point 2), we believe that a requirement to monitor third-party traffic at each relay point in the network places such severe constraints on the design and implementation of the network as to bring the feasibility of construction of such a network into question. The alternative of making the network off-limits to third-party traffic would be to fall far short of the requirements of 97.1(a).

We believe that this problem can be fixed by adding a clause to the new 97.80(b) as follows:

> [(b) No amateur station may be operated under automatic control while transmitting third-party traffic]
>
> , unless that station is serving in a relay role in a network of digital stations where the traffic was originated at a station not under automatic control.

and elsewhere when third-party traffic is discussed.

TAPR wishes to thank the FCC staff for their obvious interest in amateur packet radio and its continuing development.

/s/

With all of the talk on the net about increasing the frequency coverage of the
Icom 02-AT I began wondering about my own rig. Does anyone have information
on how to increase the frequency coverage of the Kenwood TR-2500? Or, is this
even a possibility with this rig? I am presently using an MFJ converter to
receive the National Weather Service on 152.55 Mhz. but it sure would be nice
to do away with that little black box. Any help would be greatly appreciated.

          73's
          Joe - N2EUV

P.S. Please don't tell me to trade my rig for the Icom.

hr arrl bulletin nr 16 from arrl headquarters
newington ct february 21, 1986
to all radio amateurs bt

fcc has amended section 97.61a of the amateur rules to permit f2a
emission in the 29.5 to 29.7 mhz repeater subband.

arrl had petitioned for the amendment so that f2a emission, the
primary mode used to identify by telegraphy amateur f3e emission
repeaters, would be available in the 10 meter repeater subband. fcc
also editorially amended section 97.61a to show f2a emission in other
amateur bands where repeater operation is authorized. the commission
said the amendment was necessary because the emission designator f2a
had been omitted inadvertently from those bands when the previous
emission designators were converted to the new system ar

qst de w1aw
hr crrl bulletin nr 6/5 from crrl headquarters
london ont february 24, 1986
to all radio amateurs bt

doc has informed crrl that, effective april 1, amateurs applying for
a station licence, for the first time only, will have to pay a fee of
26 dollars. the fee will drop to 20 dollars the following year.
amateurs who require a station licence for only part of a year can
pay on a pro rated basis. candidates for doc examinations will have
to pay a 5 dollar fee for each portion of an amateur radio
examination they try.

crrl has formally asked doc to continue the practice of issuing
special callsign prefixes to help canadian amateurs publicize
significant events in the life of the country. the submission
presents a plan whereby amateurs would assist doc in issuing the
prefixes, keeping doc involvement, and costs, to a minimum ar

qst de w1aw
propagation forecast bulletin nr 8 from arrl headquarters
newington ct february 24, 1986
to all radio amateurs

the solar flux curve for february is taking on the shape of a slightly irregular sine wave. from 84 on february 1 it rises quickly to 99 on the 3rd, peaks at 103 on the 5th, slides to 95 by the 9th, and tumbles down to 70 on the 17th. it has been as low as 67 since, and at 69 on the 23rd, it appears ready to start upward again.

the odds are against the flux reaching 103 in early march, as it did in february. that figure was the highest since july 1984, and we are now in what is probably the last full year of cycle 21. an appreciable rise should be underway however before next weeks bulletin.

the two week run at 85 or higher made the first half of february a very interesting time on 21, 24 and 28 mhz. now that we are back to quiet sun levels again, 24 and 28 mhz are almost devoid of dx, and 21 mhz is active mainly in the lower latitudes and on transequatorial circuits. no major change in this pattern is expected before about the 25th.

early february was marked by the most severe geomagnetic disturbances in several years. because of the 28 day month, we can expect recurrent major geomagnetic effects on about the same dates in march. this two month pattern is apparent in propagation records for february and march as far back as the 1930s. vhf enthusiasts take note that the second weekend of march should be marked in red on your operating schedule.

we were in a disturbance of milder category as this bulletin was being prepared. it should be over by the 26th. the last 2 days of february and the first few of march should be of slightly better than average propagation on all dx frequencies.

american sunspot numbers for february 13 through 19 were between 0 and 20 with a mean of 4.9.

On March 15, the Canadian DX Association in conjunction with the Toronto DX Club will be hosting a special dinner metting at the Taipan Restaurant. Cost of the authenic, multi-course, Chinese diner from one of Toronto's better Chinese restaurants will be $18.00 per person (plus taxes and gratuities).

At the meeting Rick Dorsch, Jr., NE8Z, accompanied by his XYL, will show slides plus a video on the latest HC8X DX-pedition. Much of the HC8 wildlife will be explained also.

Rick is a medical doctor. He is licensed to practice in a number of less developed countries. His past or present calls include: F0MH, FG0MH, HC1EE, HC1MD, HC5EE, HC7EE, HC8EE, HC8MD, HC8VHF, HC9A, HD5EE, HD8EE, HD8CD, HD9EE, HD9X, HD0E, HD0EE, HD8CD, KZ5GC, PJ8RD, VP2AAB, VP2EEL, ZF1CW, AND WB8ABN. His XYL has operated under the calls HC1MM AND HC8MM. Many of us have worked Rick under one or more of the above calls.

Plan to attend. It should be a great evening.
There will be a cash bar at 18:30 with dinner at 19:30 (local).
As we have to commit to the restaurant for the number of people attending, please let me know, at the address below, if you with or without your XYL, or friend are coming. Also, so that the club doesn't get stuck for paying for committed seats for people who don't show up, I

would appreciate your sending your cheque for $22 to cover the dinner,
taxes and gratuities and a similiar amount for your guest.

Wilf, VE3FEA
Secretary-Treasurer, Canadx

This is a case of direct plagiarism of a speech given by an English
raconteur and wit, Gerard Hoffnung, to the Oxford University English
Speaking Union in the early 1950s. I have a cassette of the speech
which was about a building worker taking a barrel of bricks from
the bottom of a building to the top. Apart from that and the fact that
his presentation is incredibly funny the story is identical.

The current ARRL DXCC country list follows. Changes from the
previous posting include a new field for ITU prefix allocations.

The colon-separated fields are:

1. primary amateur prefix
2. country
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. ITU prefix allocation(s)
7. other prefixes

For my own use, I added a first field containing a symbol
for status (- for worked, # for confirmed, etc.). With
programs such as sort, awk and grep, one can use the file
for printing lists by prefix, country name, continent, etc.

Please send corrections and suggestions to me.

Bill Brelsford K2DI

This posting went out to the ARPA side of the Info-Hams list during the period when the USENET gateway was down, so I'm posting a copy on the USENET side now. If you see a duplicate copy, my apologies.

I have a Hy-Gain Galaxy R-530 shortwave receiver, which right now is in need of repair. (It's a phase-lock circuit, which now won't lock, which I assume is due to component aging or alignment problems, and so it cannot tune any frequency and is worthless unless fixed. Since it was a $900 radio, I can't bring myself to just junk it.)

Anyway, the last time I had it worked on (due to a lightning strike that sent a surge thru the power lines and fried its innards), I had sent it back to the factory. This was a decade or so ago. Since then, Hy-Gain had been taken over by Telex. I wrote the factory last year and got the response that they no longer had the spare parts in stock and could not service the receiver any more, but they referred me to two possible sources for this service. I list them below. What I was wondering was if anyone on the net has ever dealt with either of these firms, or knows anything about them? If you have any info, either by personal experience or by third-hand rumor, whether it is positive or negative, please let me know. Both of these places are far away from me, and I'll have to ship the receiver UPS to either of them, so I can't investigate myself. (I'm in St. Louis, MO, by the way.)

The firms are:

CW Electronics, 800 Lincoln St., Denver, CO 80203 (303)832-1111

Jack Lingeman, 2223 So. Stuhr Rd., Grand Island, NE 68801 (308)382-3519

Also, if anyone has any recommendations for "favorite" repair shops, or those with a good reputation for working on esoteric ham gear (quality of work is more important than rates charged), I'd like to hear them!

Regards, Will Martin

How to make your otherwise unselective receiver/transceiver into a real
"DX machine":

Replace one or all of the ceramic IF filters with something with better
selectivity and stopbands of course!

Here are a couple of outfits that sell these filters on a retail basis
that don't require that you buy a minimum of 50 or more:

Radio Plus+
3635 Chastain Way
Pensacola, Fl 32503

Radio West
3417 Purer rd.
Escondido, Ca. 92505

Aiming primarily at AM filter replacements there is Radio Plus+. They
advertise filter mods for the Uniden CR2021/DX-400; Kenwood R600, R1000,
R2000; Icom R70 and R71A, Yaesu FRG series, plus many other receivers.
Filters are of the NTK and Murata Erie Ceramic type but they are the
larger ones not found in any of the commercially manufactured general
coverage receivers. His prices are reasonable (19.00 to 29.00) and the
filters perform quite well. I've put these in the Yaesu FRG7700, Kenwood
R600 and ICOM R71A with excellent increases in selectivity and
intelligibility. Filter kits are available for the new Sony 2010. SSB
filters are also available.

Radio West has some nice filters, primarily the Collins/Rockwell
mechanical type. They sell for 150.00 which includes a small circuit
board on which the filter is mounted along with a FET for a little extra
gain. Considering that Collins/Rockwell is now quoting a 144.00 price
tag with a 21 week lead time for sale and manufacture of any of its
455Khz filters, Radio West is a bargain. I have installed these filters
in my Kenwood R1000 with excellent results. Filters in stock range from
wide (9Khz at 60db) to narrow (500Hz).

International Radio in Florida (I don't have the adress on me right now,
but they advertise in most ham periodicals) has a excellent line of
SSB/CW filters for the Icom, Kenwood and Yaesu radios at considerable
savings. I installed their 2.1 Khz filter in my R71A with good results.
Prices vary. A example is the ICOM FL44A SSB filter (2.4 Khz), retail is
150.00 (some sales show them at 144.00) the International Radio filter
equivalent is 89.00. The 2.1 Khz model is avalable for 99.00.

Happy SWL'ing

I am looking for a program to predict the orbits of Oscar 10. Something in Fortran would be nice but beggars can't be choosers. I have an Apple II with a Z-80 card and of course the vax machines here at Purdue. If anyone can mail me the source code for this application I would be grateful. It is a drag searching the sky for the bird.

Thanks & 73,

Rob (KL7NA/9)

As far as I know, the original version of this story (involving a
bricklayer) is by Gerard Hofnung in his presentation to the Oxford Union,
quite a long time ago (1950's ?).

The entire presentation is on a VERY funny record.

Subject: 440 MHz repeater for sale

Tony,

In response to your notes response regarding a 440 MHz repeater:

What model is the Motorola repeater ?

What are the specs on the duplexor ?
How many cavities does it have ?
Notch Depth ? Rejection ?

What are you using for a controller ? What control functions avail ?

Your offer sounds very appealing and we would appreciate
knowing more about it.

That's when I saw saw it first too. The trouble with getting old
is that one very seldom sees a new joke and the good ones tend to
get mangled.

     The obligatory joke;

A little boy was being instructed about God in his Sunday School.
His father had also instructed him on the experimental method and
he decided to test the theory.

So he wrote a letter to God asking God to send him $100. When the
post office got the letter addressed to God they didn't quite know
what to do with it so they sent it to the postmaster who in turn
passed it on to the PM.

The PM thought that was pretty good and that he should encourage the
boys belief in God but that $5 would look like a lot to a little boy
and would probably be sufficient. He instructed his secretary to send
the boy a cheque for $5.

When the boy received it he wrote another letter to God.

Dear God,

Thank you for the $100. As you probably know it came through Ottawa
and as usual those bastards deducted 95%.

Responses to QSL information requests:

BY1PK: Chinese Radio Sports Association, Box6106, Beijing, People's Republic of China. If you know the operator was not a native, there may be a more direct route as well.

CX4HS: Alberto Symonds, Rbla M. Gandhi 485, Montevideo, Uruguay

PJ2FR: For 1983 CQ WPX SSB and CQ WW SSB 1983 and 1984: N6KT, Richard J. Smith, 3281 Loma Alta Drive, Santa Clara, CA 95051. Otherwise: van der Vilies, Ledaweg 55, Curacao, Netherlands Antilles

ZD7CW: N4CID, Thomas F. Wood, 709 West Morris Circle, Dunn, NC 28334

HH7PV: Pat De Verteuil, Abricots, Via Jeremie, Haiti. You could also try W1FJ, Al Rousseau, 180 Den Quarry Road, Lynn, MA 01904. W1FJ is the QSL manager for HH2VP, but I don't think HH7PV is the same station.

PY2FZ: Miguel E. L. Garcia, Box 55154, 04733 Sao Paulo, sp, Brazil.

ZM8OY: Mrs. Kaye Hannigan, The Terrace, Warrington, Otago, New Zealand
ZM is a special prefix. ZM8OY is the same station as ZL8OY.

LU1E: probably a special event callsign. I'd try the LU BURO: Radio Club Argentina, Box 97, Correo Central, 1000 Buenos Aires, CF, Argentina.

VP2MW: WB2LCH, Gene W. Ege, Sr., P. O. Box 64, Gloucester, NJ 08030.

4N3X: Special YU callsign, try the YU BURO: SRJ, Box 48, 11001 Belgrade, Yugoslavia.

73 and good dx
de KQ1F and K1XM

Introduction:

JAS-1 is an amateur radio satellite, promoted by JARL as a joint venture with NASDA. NEC constructed "system" units (space frame, power supply etc.), while JAMSAT, with its selected volunteer JAS-1 project team, designed and built the "mission" units (transponders, telemetry/command and house keeping micro-computer) and ground support systems.

JAS-1 has been completed and has passed all the necessary tests. It is in a clean room waiting for the launch, currently scheduled for August 1986.

The outline of this unique satellite is explained in the following.

Many thanks to Harold Price, NK6K, for his assistance in the preparation of this article.

- -

JAS-1 Mission Objectives:

1. JAS-1 will provide reliable world-wide amateur radio communications.

2. JAS-1 will enable radio amateurs to study tracking and command techniques.

3. JAS-1 will offer an in-space "proving ground" for radio amateur developed and built transponders and sub-systems.

4. JAS-1 will provide NASDA an opportunity to carry out a "multi-payload" launch using their new "H-1" launcher. (NASDA has never engaged in a multi-payload launch, thus the JAS-1 project will offer NASDA an excellent opportunity by providing them with an active payload having its own telemetry-beacon and transponder for ranging.)

- -

1. Form and general dimensions:

The spacecraft takes the form of a 26-facet polyhedron, which measures 400 mm X 400 mm X 470 mm and weighs 50 kilograms.

2. Launch and Orbit:

JAS-1 will be launched into a circular low-earth orbit, which will be non-sun synchronous and non-polar.

Launch vehicle	: H-1 2 stage rocket
Launch number	: Test Flight # 1
Launch site	: Tanegashima Is. Japan
Launch date	: August 1986
Estimated inclination	: 50 degrees
Estimated altitude	: 1500 k.m.
Estimated period	: 120 minutes
Estimated window per pass	: 20 minutes/pass
Estimated passes per day	: 8 passes/day

3. Designed life:

Estimated lifetime is 3 years

4. Special Features of JAS-1:

JAS-1 carries two separate mode J transponders. One is a linear transponder, and the other is a digital "store-and-forward" transponder mainly for non-real-time communication between stations located in different time zones.

The reasons for selecting mode J for this first Japanese amateur radio communications satellite are:

a) It is becoming increasingly difficult to use 145-MHz for a satellite downlink because of man-made electrical noise and other interference.

b) The planners of JAS-1 wanted to provide a successor to AMSAT OSCAR-8's mode J, which was originally developed by JAMSAT's engineering team back in 1976.

c) 435 MHz is much quieter than 145 MHz as a downlink band, it is comparatively free from man-made noise and sky-temperature effects.

The digital transponder will provide "error-free" information exchange.

5. Transponders:

a) The linear transponder = mode JA :

The passband will be 100 kHz wide. The transponder will have an output of 1 watt p.e.p. Ground stations will need an uplink power of 100 watts e.i.r.p. The sidebands will be reversed, i.e., the uplink is LSB, the downlink is USB. There will be a 100 mW c.w. beacon switchable to PSK when needed.

Uplink pass band : 145.90 MHz - 146.00 MHz
Downlink pass band : 435.80 MHz - 435.90 MHz
Beacon freq. : 435.795 MHz
Translate freq. : 581.80 MHz

b) The digital transponder = mode JD :

There will be four 145 MHz band input channels using Manchester coded FM for the uplink. Ground stations will need 100 watts e.i.r.p. There will be one downlink channel in the 435 MHz band using PSK, the

output will be 1 watt RMS.

Channels are :

```
Uplink   channel 1 : 145.850 MHz
  ,,     channel 2 : 145.870 MHz
  ,,     channel 3 : 145.890 MHz
  ,,     channel 4 : 145.910 MHz
Downlink channel   : 435.910 MHz
```

The data format is HDLC. The protocol is AX.25 Level 2 Version 2. The data transfer rate is 1200 bps for both uplink and downlink.

The reasons for not using Bell-202 type FSK modulation are:

a) To reduce the parts count onboard JAS-1. Using Manchester coded FM for uplink reduces JAS-1's onboard decoder chip count by 16.

b) To improve the downlink margins. Due to JAS-1's tight power budget, only 1 watt is generated by the downlink transmitter. A more efficient modulation scheme like PSK is required.

JAS-1 will be a store and forward system but not a real time digipeater. Digipeating is not an effective use of a low orbit satellite such as JAS-1, which has a limited communication foot print and visibility time.

JAS-1 has 4 uplink channels for 1 downlink channel. This is because the difference of channel efficiency between uplink and downlink. An uplink channel is shared by several ground users. Since the ground users can't hear each other, and are listening to the downlink channel anyway, the uplinks are subject to packet collisions. This scheme is called "Pure ALOHA", and is known to have a theoretical maximum channel throughput of 18.4%. The JAS-1 downlink is 100% efficient, since only JAS-1 transmits there. To balance capacity, as well as add redundancy, four uplink channels are used.

The combined uplink efficiency is then 4 * 18.4% or 76%. The remaining downlink time is used for general messages and telemetry data.

JAS-1 will accept a connect from only one station at a time with the software scheduled for initial use. Multiple connections will be supported in subsequent software updates. General packet operation is scheduled to begin in November 1986.

6. Digital Hardware:

The microprocessor is a MIL-STD-883B screened NSC-800 running with a 1.6MHz clock. This is the only processor on board. It controls the digital transponder and also acts as an IHU (Integrated Housekeeping Unit).

The on-board memory has a 1.5MB physical storage capacity. 48 chips of NMOS 256K DRAMs are used. A hardware based error-detection/correction circuit is incorporated to protect the entire 1.5 MB and provide an 1 MB error free memory area. The system program occupies some 32KB, the rest is used for message storage.

The memory unit is physically divided into four identical 256KB memory cards, any one of which can be assigned as the system area. Up to three cards can be turned off. This design provides system redundancy and allows command stations to control power consumption without a total loss of service.

JAS-1 has five hardware HDLC controllers. Four of them are for the uplink channels and one is for the downlink channel. In total, these controllers consist of some 140 CMOS MSIs, yet their power consumption is less than that of a single NMOS LSI HDLC controller like WD-1933.

JAS-1 does not have any ROM but has simple hardware boot strap circuit instead. This design is to increase system flexibility and reliability.

7. Power system:

25 of JAS-1's 26 faces are covered with a total of 979 pieces of solar cells. They will generate 8.5 watts of power at the beginning of life.

JAS-1 employs 11 Ni-Cd battery cells with a capacity of 6 AH. These supply 14 volts average to JAS-1's main power buss. The 14 volts is converted and regulated to +10V, +5V and -5V.

8. Antenna system:

JAS-1 has three antennas.

2 m reception antenna

Slant 1/4 wave Mono-pole	Isotropic	-4 dBi gain

70 cm transmission antenna

Mode-JA : Slant Turnstile L.H.C.P. +Z axis +3 dBi gain
Mode-JD : Slant Turnstile R.H.C.P. -Z axis +3 dBi gain

9. Attitude control:

Forced shaking using the earth's geomagnetic field. JAS-1 has two 1 ATm sq. permanent magnets in its Z axis.

10. Telemetry:

Analog system telemetry has 12 analog channels and 33 system status flags. This telemetry can be sent without the help of the NSC800 microprocessor and will be turned on automatically by the separation from the H-1 launcher. The telemetry is sent on the 100mW beacon on 435.795MHz in CW, switchable to PSK.

Digital system telemetry has 29 analog channels and 33 system status flags. This software driven telemetry can be sent in any format, and can include short text messages. This telemetry can be sent on either the mode JD downlink channel (435.910MHz) or the mode JA CW beacon (435.795MHz).

11. Command:

A simple 3-channel tele-command system is used for global control functions, e.g. JA transponder "ON"/"OFF", JD transponder "ON"/"OFF" and independent "ON"/"OFF" of the A-0 beacon. An additional 37 channels are available mainly for controlling the digital transponder.

Onboard command from the NSC-800 is also available.

12. Ground stations:

Mode-JA:

A ground station setup which was used for Amsat Oscar-8 mode-J can be used for JAS-1 mode-JA. A station with a 10 watt 2 m SSB transmitter and a 10dBi beam for uplink; and a 70 cm receiver (with low NF) with a 15dBi beam for downlink; should be adequate for this job.

Mode-JD:

In addition to the mode-JA set up, FM mode is required for the 2 m transmitter.

Since JAS-1 uses the standard AX.25 protocol and 1200 bps data rate, ground stations will be able to use a TAPR-style TNC, a 2 m FM transmitter and a 70 cm receiver without modification.

The JAS-1 modem, a special interface board, will be made available containing the Manchester modulator and an audio PSK demodulator allowing connection to the "modem disconnect" connector of a TAPR-style TNC. The modem also connects to the audio input and PTT of the 2m FM transmitter and to the audio output and frequency control (option) of a 70 cm SSB receiver.

Although JAS-1 will be available to individual access, the general amateur community will benefit from "JAS-1 gateways". Messages relayed through gateways can be sent worldwide and is as easy as sending messages to distant stations via a W0RLI HF gateway.

13. Outline of project history/schedule:

November 1982 : Freezing of conceptual/preliminary design

December 1982 : Preliminary Design

April 1983 : Detail Design
- June 1984 Engineering Modules Integration & Test
Ground Support System Integration

July 1984 : Flight Model #1 Integration & EIC/MIC
- December 1984

January 1985 : Flight Model #1 General Test
- March 1985

January 1985 : Flight Model #2 Integration & EIC/MIC
- August 1985

August 1985 : Flight Model #2 General Test
- November 1985

November 1985 : Software development.

Now that the Philipines have ousted their old government (and taken
over the national voice of the Phillipines by force), I would very
much to give them a listen, but I can't find them at any of the
frequencies in my guide. For that matter, does Haiti have a radio
station?

Also, in case you're interested, radio Nicaragua can be reached on
6015 in English for about an hour starting at 0400. The problem is
that VOA comes on half an hour into their broadcast and starts interfering.
I find that their programming consists of A) propaganda, B) real news
and C) american space-cadets who came down to Managua "be one with
the revolution" or something like that. It's easy to recognize the
propaganda and space cadets and filter them out. The real news can
be an eye-opener, as they cover a lot of stuff the American press won't
touch.

The question of IRCs versus dollars is, unfortunately, not simple. The
best one depends on what country you are QSLing to. For example:

When sending a QSL to VU you should use IRCs because it is illegal for
Indians to have American Dollars, and you could get them in BIG trouble.

ZL hams are also not supposed to receive dollars.

In Australia, an American Dollar is not sufficient for air mail postage.

In 3D6, it takes lots of IRCs to buy an air mail stamp (I think 5). If
you work one of the missionaries, you can send a dollar instead, and it
will cost you less and give him more.

In Ecuador, at the moment it is possible to buy IRCs but not to turn them
in! You are better off sending a dollar (which they can change to sucres)
if you want a card.

If you are a foreign ham sending to the US, and you have access to IRCs and
to dollars, you should send either $1.00 or 2 IRCs, whichever is cheaper.
The post office charges 65 cents for an IRC, and returns 35 cents. However,
most hams who receive IRCs don't turn them in; they re-use them, or they
sell them to other hams at some price between 35 and 65 cents.

The best thing to do usually is to ask the other ham what he prefers, if
in doubt send IRCs (you can get the correct number of IRCs from a list in
the Callbook).

Subject: scanner antennas

Austin Custom Antennas sells a fairly effective scanner antenna. If it is not
available locally at your favorite ham radio store (if there are any left)
you can order or obtain information from Dick Austin at:

     Austin Custom Antennas
     P.O. Box 357
     Sandown NH 03873

     Telephone: (603) 887-2926.

I haven't tried his scanner antenna, but all of his products which I have
tried have worked extremely well.

The log-periodic is another quite valid approach, but it is of course
directional. You might want one of Austin's units or something designed
along the same lines even if you also buy or build a log-periodic.

Incidentally, Dick will quote on custom antennas for specialized purposes,
as the name of his company suggests. Hint: his current hot item is antennas
for cellular mobile telephone service.

                              73 to the net,
                              John S., W3IKG

The following is a list of frequencies where English language press stations can be found on HF. This list is from personal monitoring and not copied from any other lists!

These press stations all transmit in English, some all the time, others just occasionally.

The "SB" column indicates USB or LSB to be selected for normal copy.

The "SH" column indicates the shift (Mark to Space frequency difference) used. Note that most use 425Hz shift.

The "BD" column indicates the baud rate, not words per minute. This is standard Baudot rtty code. Most foreign stations use "FIGS J" as the bell and "FIGS S" as apostrophe, which is the reverse of American machines.

The "M" in the "BD" column indicates that the station is a frequency division multiplex transmission using 16 to 24 subcarriers. The shift is usually 85 Hz and many terminal units will not copy this. Receiving these fdm stations with the bfo off sounds like a buzz-saw. These stations are the best source of AP/UPI news, quite similar in format to the wire line press service sent to radio stations. The best way to tune these in is to select USB, tune onto the station from the high frequency side to the upper-most subcarrier. This subcarrier is usually the one carrying the news. They may be either 50 or 74 baud.

The "SVC" column shows the abbreviation of the news service.

The "CALL" column is obvious. Not all stations give identify with a call sign. Some use the same call sign on all frequencies at once, and some have calls for each frequency in use, but do not indicate which call is for which transmitter.

Not all stations of a particular service carry the same text. The VOA, for example carries as many as 4 different "programs" at the same time. the ARF, however, has the same text on all 4 frequencies at once.

I have not given times of transmissions. That is too difficult to pin down accurately. Many stations are on continuously.

The frequencies given are within 2 kHz. Some stations do slide up or down a little, reverse their mark and space frequencies on occasion, and my receiver readout does not include the amount of bfo offset (about 1.5 kHz).

Happy tuning de K9EUI

re: problem with power in a balanced modulator

I think your problem is that you assumed that the diode characteristics
fit a pure square law .  Actual, ideal diodes contain higher terms,
third, fourth, etc. power.  An ideal diode is  I=Io(1-exp(eE/kT)), which
must be expanded in a power series.   In the balanced configuration all
odd terms cancel so you are left with the square, fourth power and
higher even powers.  Your math only took into account the first square
term.  I did not work it out but I believe that is the problem.

                  Joe  N2XS

Sending money to a HAM to cover postage is not a violation of the amateur code. And I think what was meant by "the main source of income of the island (though it isn't an island)" is the postage industry, not the HAM!

Jim

qst de k9eui
hr arrl bulletin nr 96 from arrl headquarters
newington ct november 4, 1985
to all radio amateurs bt

by fcc report and order released october 31, non government radio location has been given primary status at 1900 to 2000 khz. this action in pr docket 84 874 relates to the projected allocation of 1605 to 1705 khz to broadcasting, which will displace radio determination stations in that range. effective december 9, 1985, amateur stations in the 1900 to 2000 khz range must not cause harmful interference to the radio location service and are afforded no protection from interference arising from radio location operations.

this is not as bad as it seems, however, as fcc will not accept applications from radio location stations at 1605 to 1705 khz for moves to 160 until july 1, 1987. according to fcc, this means that amateur operators will continue to have virtually exclusive non government use of 1900 to 2000 khz until private radio location transmitters become operational. january qst

will carry further details ar

qst de k9eui
hr arrl bulletin nr 94a from arrl headquarters
newington ct october 30, 1985
to all radio amateurs bt

during the 7 day spacelab mission d1, astronauts dg2km and
dd6cf will operate amateur station dp0sl.

there will be three modes of operation, 1, beacon operation
with inserted callsign, no receive. 2, beacon operation with
automatic recording of incoming calls. there will be one
minute receiving time with recording of received calls on tape.
3, two way voice communication using f3e emission. the normal
channel pair will be 145.575 mhz transmit, 437.275 receive.
other pairs are 145.450 transmit 437.125 receive, 145.475
transmit 437.175 receive, 145.550 transmit 437.225 receive.
additional receive frequencies are 437.325 and 437.375 mhz.

an effective radiated power, erp, of 20 dbw is recommended for
contacts with spacelab. for example, a 70 cm transmitter with
10 watts power output combined with a 10 db gain antenna would
be a good choice.

qst de k9eui
hr propagation forecast bulletin nr 44 from arrl headquarters
newington ct november 4, 1985
to all radio amateurs bt

for several months solar activity has been lower than might have been expected at this point only about nine years into solar cycle 21. at the middle of october there was a remarkable reversal of this trend. the first sunspot activity of any consequence since last july appeared on the east limb of the sun october 15. in a few days it produced solar flux readings of 95 on october 22 and 23, and a run above 75 for 12 consecutive days. the most recent 75 had been logged on august 11.

this rise could not have come at a better time, as we are just entering the prime dx season for the northern hemisphere. the second half of october saw 21 mhz open over much of the world, and 24 and 28 mhz were more active than at anytime this past year. though the solar flux was back down to 70, both 21 and 28 mhz were fairly productive in the recent arrl sweepstakes and cq ww dx contests.

judging by the shape of our october solar flux curve, there is a fairly good chance for another surge beginning about november 11, when the same area of the sun will be facing the earth again. this could begin as early as november 6, as there was a

small bulge in the flux curve beginning october 9.

as this bulletin was being prepared, we were at the peak of a strong geomagnetic disturbance. this should be giving way to improved propagation november 4 to 6. mildly disturbed conditions may be with us much of the time through november 19. the best overall time of the entire fall should be november 20 to 28, with the muf the highest at the beginning of that period.

american sunspot numbers for october 24 through 30 were between 0 and 53 with a mean of 11 ar

For Pete, VE5BEL, ihnp4!sask!hardie@seismo.css.gov--

My mailer won't seem to talk to your mailer in reverse, so I have to put my reply note here on the net. Sorry for the clutter, gang.

--Jim, K6ZH

Pete--

Thanks for your netnote. It came thru loud and clear. The next question will be, are you reading this?

I was in the CQ WW phone contest which was the last weekend of October. I guess I shouldn't say "in" so much as being a casual observer!

I have a Ten-Tec Argonaut which I've had since Dec. of '83 (an Xmas present from my XYL!) I got my WAS in about 6 months with it, but have not seriously considered dedicating my heart and soul to QRP DXCC with the sunspots being as they are. I have worked 54 countries

and have about 40 confirmed thus far. Need only Africa for QRP WAC.

WAS was easy, and even 40 meters was very good to the East Coast on QRP. DX is much harder, and I finally bought a beam last year. It's not much, a TH-3 JRS, but wow, what a difference! Virtually all of my DX has been on 20 and 15 with the exception of a few on 40. I can therefore suggest that if you don't have a beam, get one.

I can also suggest that it's helpful to use "/QRP" with your call when you're trying to get a station's attention. Probably not so useful in pileups, but with only a couple of stations calling it sometimes gets you thru. Most stations will bend over a bit to work QRPers, it seems.

Otherwise, patience and persistence are necessities of QRP life.
I have a programmable keyer that I use in contests--saves some of the frustration of sending my call a zillion times!

Keep in touch. We can try a sked if you'd like some time.

Thanks for the QSL info. 73--

Jim, K6ZH

Sorry that my attempt at humor has turned so many flames on (pse save them for those mongolian marvels of manual dexterity and their Onan generators).

I've worked Tony on 4 bands and have QSL cards for all. I wish that others, like FR0FLO, were so organized and prompt in returning cards. The stamps, as the N7 pointed out, are quite attractive. And, yes, *flame off please*, San Marino is indeed not an island.

As in other cases, claims of number are exercises in futility as others always have more (or are bigger!), I have done as many: I have 5-Band DXCC and 289 worked total with 288 confirmed. Discounting my "donations" to VK9NS and other Heard Island expeditions, and others, that's quite simply one heck of an investment in QSL's. Most foreign hams were QUITE cooperative. No one has twisted my arm to get involved in this, and I have quite freely paid my greenstamps and IRC's.

Being from the John Riggins school of amateur radio, I'm not as inclined to take this fine hobby as seriously as some of you on the net seem to. Sorry that my attempt at humor has pulled any chains (I'll leave the leg pulling to our friends in JT0). This certainly isn't the Geritol net, nor is it the Black Sheep of 3.795 fame. So, let's put our flames away and not let it become the Metamucil Net. For my part I'll try to keep my humor to myself.

Hope everybody is getting ready for CW WE.

Here on the east coast we have noticed a lack of activity on 2M SSB.
If anyone is planning to operate 2M SSB, please let me know. The
multipliers well help us all.

By the way for those interested in DX, I heard a ZA3DED at the bottom of
75 CW last night (3501.5)   A couple of guys worked him. As far as I know, there
is noone active
in ZA3 land at this time. More tham likely a bootlegger.

Good luck in the CQ WE.

Does anyone know if a data base of US hams is online? Our Salem (Ore.) radio club wants to have a "Get Acquainted" meeting at our normal March meeting, and we want to invite all Salem area hams. I thought if I could get hold of a data base for US or Region-7 hams, I could grep for our local zip codes and get a mailing list for sending out invitations.

For those needing a QSL from that rare DX station, there is a better way. A good friend of mine, George Robertson W2AZX, runs a DX Stamp Service out of his home. George will sell you a first class airmail stamp from virtually any country in the world. Thus, you send the DX station (or his foreign QSL manager) a self addressed stamped envelope with his own country's postage, and all he has to do is slip in your card and mail it. George's prices vary from country to country but generally are in the $1.25 range. This is often cheaper than IRC's and less hastle for the DX station as well. In addition it avoids the theft and possible currency law violation problems of "green stamps". George fills most orders within 24 hours. If there is enough interest, I'll put his price list on the net. Alternatively, you can send a sase to:

DX Stamp Service
G. N. Robertson, W2AZX

7661 Roder Parkway
Ontario, New York 14519

George lives just down the road from me, so when I work a rare one I can get stamps the same day. I find I get very fast response from DX stations and often receive favorable remarks on the cards as well. The convenience is definitely appreciated.

Someone had a query on here recently about broadband antennas suitable for
scanner applications.  I was just looking at a brochure I got from Butternut
Electronics recently (I was interested in their multi-band verticals) and I
noticed that they are advertising the "SC-3000" scanner antenna.  Advertised
specs are: 1) 30-512 Mhz 2) omnidirectional 3) "Receive gain - UHF up to 7 dB,
VHF up to 3 dB, low band unity gain."  Suggested list price was around $60.

This is particularly intended for anyone needing replacement FET's
used in the Heath IO-105 scope.

I assume that other Heath scopes use the same device in them:

I am referring to the SCF-2912 in the front end of the vertical amps,
and other places. Nowhere could I find this device listed and did not
want to wait for an order from Heath - I needed the scope NOW!

The result was that I tried a Sylvania ECG-452 and it works perfectly.

Other type FETs tried may have worked if the mate in the other side
of the differential circuit would have been replaced with the same type.
But I could not get DC balance just changing the bad one.

I do not understand the so-called diode protection circuit in the input
circuit. The gate of the device is at zero volts. Why are the diodes
connected to a voltage divider rather than ground or at least something
"stiffer" than this divider. The divider will allow excessive signal
input swings to destroy the input FET.

On the whole, I have been pretty satisfied with this scope (It is the
first dual-trace Heath scope). I bought it second-hand from a friend.

However, This scope went thru 3 power transformers! In one case the
scope was sent back to Heath for repair, where they replaced the
transformer themselves at least once. After getting it back, the
transformer went out again after 24 hours use. The problem each time
was breakdown in the high voltage winding of the transformer.
I took the last one apart and could see the sloppy winding job and
where the breakdown occured. Heath would not admit to having any
problems like this. Out of warranty, I could not see spending the money
for another one of their bad transformers. I ended up bolting the
scope on top of a 3 inch high Bud chassis and rebuilding the entire
power supply section in there. I used an old Knight photoflash
transformer for the high voltage source and have had no trouble for
the last several years.

Horizontal triggering leaves something to be desired but otherwise
the scope is fine. Sure glad I did not buy it new for $400!

Has anyone else out there had any notable experiences with the Heath
scopes?

Oh yes, Since it would not auto-trigger on lower audio frequencies, I

increased the value of one of the coupling capacitors and that solved
that problem.

BRAVO!!!

I agree whole heartedly with Brian. What ever happend to the Ham Radio of
build it yourself/fix it yourself. These days the majority of the rigs we
hear on the air are Japanese rice-boxes operated by glorified CB appliance
operators. What about perpetuating a pool of "trained radio technicians."
Wasn't this part of Ham Radio (or something to that effect) the reason for
Ham Radio in the first place?

What about the propagation of international brotherhood? Since when does

"Your five-nine in Ohio 73..." propagate brotherhood? Have you ever tried to demonstrate the hobby to a newcomer on a conversation such as that?! What kind of accomplishment is it to contact "some-unknown-little-foresaken-island" using maximum legal power and a big store-bought antenna just to exchange false (usually) signal reports? Some suggest removing the code requirement. If that's done, then really what would be the difference between Amateur Radio and CB, other than the fact that skip is legalized on Ham Radio. The day that is done, I send my license in for cancellation!

>So please! Tolerate the not-ham-radio-the way-the-ARRL-invented-it
>traffic as well as the more traditional stuff here in ham-rado. Some of
>us like it!
>
> Brian Kantor, WB6CYT
>

Whoever said that the ARRL is the god of amateur radio? They seem to have put themselves in that position for the primary reasons of self-propagation. Afterall, the more unsophisticated amateurs there are, the more suckers there are likely to be who will send that good-for-nothing organization membership fees. I learned early, I quit after one year. They are the biggest offender of commercialization of amateur radio. Their magazine (not a journal by any means!) used to have some good technical articles. Now it is mainly filled with useless statistics and adds for Japanese junk!

To conclude my flame, I'm all for technical talk on this note category! Technical discussion is part of the hobby. As far as political debates, I feel that it should find another category since it is not at all related to amateur radio.

Well, after two months and three trips to the local Kenwood service center, my TR-7950 finally works again -- almost.

For those who may not remember, the problem was that the receiver section of the rig would "motorboat" whenever a signal was received. (I don't know whether there were any problems with the transmitter portion of the rig, because since I was unable to hear anything intelligible I was unable to get a signal report from anyone else!)

Anyway, they said they had found (and fixed) some cold solder joints in the PLL (phase-locked loop) board. I had previously supposed that cold solder joints were primarily a "dead on arrival" or "infant mortality" problem (I've had this rig for over a year and a half). Then again, the vibrations attendant to operating "mobile" might (I suppose) aggravate a latent weakness in the rig and eventually cause a failure.

Now for the bad news. Whenever I receive a signal, there is now a faint high-pitched whistle in the received audio (very similar to the sound of a "singing" flyback transformer in a TV set, except that in this case the whistling sound is definitely coming through the speaker and varies in loudness according to the setting of the volume control). The rig was NOT doing this before the problems arose; just to be sure, I checked another Kenwood TR-7950, and this high-pitched whistle does not appear to be a generic failing of this entire make of radio.

This "whistle" is not very loud, by the way -- just loud enough to be heard and to be very annoying.

People, when asked how my signal sounds, almost invariably tell me that I sound just fine. They specifically deny hearing any kind of high-pitched noise on my signal. (Of course, their rigs might have low-pass filters in the audio section -- in which case they wouldn't hear a

whistle even if it were there.

I eventually discovered that I could get rid of the whistle by tweaking a trimmer capacitor in the voltage-controlled oscillator on the PLL board (TC2, near Q9; the VCO is mounted in a little metal shield box on the PLL board). Unfortunately, if I tweak the trimmer enough to get rid of the whistle, the rig will not transmit! (There is a small "window" of adjustment in which the receiver section continue to work fine, even though transmission on part or all of the band becomes impossible.)

I have inspected the boards and the inter-board cabling thoroughly, and there do not appear to be any stray paths for a signal to be getting into the audio from the VCO.

Under no circumstances am I going to take the rig back to Kenwood to have this fixed! There's no way I'm going to give up my rig again for weeks on end.

Any ideas on how to find and fix this problem?

I have had good service from an IO-4510 Heath scope with one exception similar to Bob's. The front end is a FET differential pair which has a bad DC drift with temperature (the 4510 is DC coupled). Once after leaving it on in the upright position for 3 days the DC offset (kinda dumb anyway) the DC offset went too far for the trimmer pot rendering it useless.

Has anybody got any ideas about a cheap fast front end, DC to about 25mhz.

which I can use to replace the fet front end?

By the way the scope is very nice. The bandwidth specs. are conservitive
and the trigger works very well.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
Aside from the pros and cons of japanese-made rigs (I have a Ten Tec Argonaut
and an old pair of heathkit Twins - the SB401/SB303), the inclusion
of aserial I/O port allows control of the rig from a remote. A recent
article in QST Magazine outlined a short BASIC program for doing this with
the new Yaesu FT757GX xcvr. (I've actually been toying with acquiring

one of these so I could rig it up with my Model 100 lap-portable).
The feature was written by Kjell Strom, SM6CPI and appears on page 38
of the October 1985 isse. The article also references the following publicat-
ions:

QST, July 1984, p.34, Low Cost Computer Control for the ICOM IC-720;
QST, August 1982, p.19, control of an ICOM IC-701;
QST, May 1981, p. 30, re IC-701;
The 1985 ARRL Handbook for The Radio Amateur, 62nd Edition, C. Hutchinson (ed),
ppgs. 19-24, Fig. 26;
and
Compute! Magazne, August 1982, J. Butterfield and J. Law, VIC Communications:
the RS-232 Interface, p. 99.

So there! I hope this is of interest and I would be quite interested in
learning how others are making out with similar systems of control.
My ideal system would allow the MiniMUF program to pre-set the rig at
the appointed hour for either AMTOR or packet transmissions with automated
message store/forward nodes! I'd also like to find out if anyone has
experienced any problems/solutions with emi/rfi while using these rigs
under program control.

x

I recently installed a Butternut SC3000 tri-band scanner antenna on the chimney of my ranch house. The ham-fest price was about $50, $10 lower than prices advertised in the radio magazines.

This is my first outdoor scanner antenna since 1976, so it seems like I can hear "everything" with the SC3000, compared with the indoor antennas to which I've grown accustomed.

It's difficult to evaluate the performance of the SC3000, having just moved to this location and few other antennas installed yet for comparison. On VHF-Hi, the SC3000 equals, or exceeds, a 2 meter Cush Craft Ringo (not the Ranger) mounted 3 feet lower. I'm pleased with the Butternut's UHF performance, often hearing the county sheriff's cars on the repeater input.

I've a few gripes with the SC3000:

- The main vertical element is insulated from DC ground, posing a potential lightning hazard. I

worry about this, and keep the station end of the RG8/U coaxial cable shorted to ground when not in use.

- Assembly was hampered by a scant, one page instruction sheet. It was impossible to place one of the tuning pieces at the exact position called for in the instructions, and the poor fit between two other pieces required improvisation using a shim. No technical discussion is provided, so the theory behind this unusual antenna remains a mystery.

- I had trouble mounting the SC3000. It's supposed to mount over a 1" pipe or inside a conventional 1 1/4 inch tv mast, but it just wouldn't fit inside any of the three 1 1/4 inch Radio Shack steel masts I tried. No brackets or U-bolts are provided, so I had to obtain a set of U-bolts, and mount the antenna in an unorthodox fashion.

- Even though the SC3000 is spec'd at unity gain for VHF-lo, the 19" radial system is really for VHF-hi, so I don't expect very good results on the 30-50 MHz range.

Being an agricultural area, the terrain is flat in this
county, and the winds get quite brisk. The SC3000 is rather frail compared to a Ringo or Hustler G6-144, and dances around in the gusts, but has remained intact for 2 months now.

After rebuilding the power supplies for my Heath 105 scope, I also had quite a bit of vertical drift. The drift was caused by the power supplies that power the vertical amplifiers (among other things). I had used 78xx type regulators for the positive supply but used zener-to-pnp series pass for the negative supply.

After finally obtaining the proper 79xx type negative regulator and replacing the zener referenced supply with that, the drift went away.

The vertical amp has a lot of gain and ANY power supply variation will cause drift.

I have found that while the absolute value on these 78xx and 79xx regulators is not super good, they are super stable and drift-free. In other words, if you want EXACTLY 5 volts, you may have to hand pick one from a dozen or so.

I used to have a TS-820, and used the transverter plug to do what you want. There is a switch on the back of the radio which must be set in the transverter position. This switch opens the receive line so you can patch your filter or external antenna to it. I had two pieces of RG-174 coming out of my transverter plug, and had a box which would connect them for normal operation or connect the beverage to the receiver input. I also used to connect a second receiver to the transmit antenna through the box, and also an external attenuator and a preamp. The

transverter switch on the TS-820 also opens the screen line to the final amplifier tubes. You have to put a jumper in the plug which reconnects the screens. I don't remember the pinout for the plug, but knowing what it is supposed to do you should be able to figure it out from the schematic. I think the TS-520S also had the same plug and pinout.

If you can't get it to work, I will look for the plug, and if I still have it I will let you know how it is wired.

qst de k9eui
hr crrl bulletin nr 29 from crrl headquarters
london ont november 11, 1985
to all radio amateurs bt

representatives of crrl and carf met with doc officials in ottawa on october 25. much of the discussion centered on docs new proposal for restructuring the amateur service. crrl and carf are honoring a commitment not to make details of the proposal known until notice of it appears in the canada gazette. at that time, copies of the proposal will be available from all regional and district offices of doc. there will then be a 180 day period in which amateurs, their organizations and other interested parties may comment. further details later.

doc confirms that the removal of frequency and power restrictions on the 160 metre band includes the removal of the no mobile restriction as well. mobile operation is now

permitted on 160 metres.

section manager elections are now under way in the alberta and maritimes/newfoundland sections ar

qst de k9eui
hr propagation forecast bulletin nr 45 from arrl headquarters newington ct november 11, 1985
to all radio amateurs bt

mentioned as a possibility in last weeks bulletin, an upward trend in the solar flux curve did begin november 5. from 69 on the 4th, the flux was up to 75 by the 8th. just as it did 4 weeks earlier, the curve then dropped one unit, holding there for two days. it remains to be seen if the larger rise that began october 13 will be with us a second time. the several active centers that pushed the flux up to 95 then are due back early this week. if nothing comes of it, we will put on a corrected bulletin later this week. regardless of the flux level, propagation is likely to be very erratic but with an overall trend to better conditions through about november 20. though flux levels may be down, signal strengths and quality should average better november 20 to 25 and 26 through 28 than in the earlier part of the month. the muf for northern hemisphere paths should be the highest of the year at those intervals. the month is likely to end with strong disturbances, but with the muf lower as we move into december.

the author of these bulletins is on his way to florida this week, to assume permanent residence on the gulf coast. mail for him should carry the following address,

edward p. tilton, w1hdq,
p.o. box 5527
spring hill, fl 33526

american sunspot numbers for october 31 through november 6 were
between 0 and 14 with a mean of 3.4 ar

    Use a log periodic antenna - they are simple to build for that
frequency range. Or, if you want to mount something on a rotor for
directivity, try a log spiral antenna - which is also simple to make from
a large piece of PC board stock.

Your article on the Cellular telephone service was good. I had a lot
of trouble with the FTP, though. Others experiencing difficulty might
try it with all caps, and a "1" after the name, leaving
<GEOFF>ARTICLE.CELLULAR-SEIVE.1
as the name of the remote file.

This worked ok for me.

The temperature problems with DC balance might be cured by making sure that the two devices in the diff pair are thermally connected. Several of the semiconductor mfgrs make matched diff pairs in a single package. These are very fast and very closely matched. Try Siliconix, they have some. I looked very quickly and they have a dual that is designed for wideband differential amp applications. The device number is 2N5564, -65, and -66. I am sure that there are other vendors, and you didn't specify the parameters needed (gfs, quiescent current, etc.).

I am not going to repeat what has gone before, but there are many people in the ham radio world. Most of them are appliance operators (I have several appliances here too). For many the entire world is between 1.8 and 30Mhz.

On the other hand, there are many people who build their own gear, interface with their computers, design microwave gear, do EME, and all other sorts of interesting things.

My point is this; please do not dump on someone because he/she enjoys an aspect of our hobby that does not appeal to you. If you do not like the DX bulletins, exercise your right index finger on the 'n' key and go on to the next article. --**PLEASE**-- do not start a flame section of the DX vs. tech operation sort. I, for one, do not want to hear it.

Roger,

Aren't you being a little bit hard on the ARRL and their "commercialized maga-
zine?" I just received my Tech license recently and still enjoy seeing the
ads for the many new and different products on the marketplace. Maybe we
should write to ARRL and request more technical articles, but at the same time
I believe they have done a good job over the years promoting and protecting the
rights and privileges of us Hams. By the way I was WA0BNM back in the early
'60's.

Well, I have been sitting here reading the comments on DXing and the ARRL.

First, on ARRL: The QST mag has not contained as much tech stuff as in the past. But, it still gets a lot of info out for everybody, from the begining builder to the contester or DXer. Not to mention the clubs across the nation. It has a purpose in Washington. You may not agree with their views all the time (I know I don't), but still they are the only one there representing us. For that they got my money.

Second, DXing. I have always said that this hobby has something for everyone, be it building, ragchewing, RTTY, CW, DXing or what. If your interested, you can find your niche.

If some quys want to sit for long periods of time on a list to work DX, fine, let them sit there. I don't see them posting to the net complaining about builders not using their equipment.

I have sat on a few list. Because thats the only place some DX station will operate. So if you want to work them on the list you sit. Not all DX contacts are of the slam bam varitey. I have had some very nice QSO's with some rare DX stations at times.

Enough from my soap box. Good whatever to you all be building or DX or list sitting.

73,
Larry

> transmission would make cellular signals difficult to intercept with
> ...

Digital speech encoding was not used in the cellular telephone concept for reasons of practicability including, but not limited to:

1. The cellular telephone design concept was considered to provide sufficient security to deter the casual listener using consumer-grade `scanners', antennas, etc.  No attempt was even considered to deter a `serious' listener who could spend many thousands of dollars for antenna towers, sophisticated receiving equipment, etc.

2. The cellular telephone concept was intended to be LOW cost and be capable of independent multi-vendor support. Therefore, hardware had to be as simple as possible without employing any one vendor's proprietary technology. While Motorola pretty much developed the cellular concept, they never did it from the standpoint of monopolizing the cellular market - such a monopoly never getting cellular telephones off the ground. While Motorola has also pioneered digital speech encryption using CVSD modulation in their DVP radio systems, this was mostly proprietary technology which Motorola was hardly going to share with the world.

3. Had a digital encryption circuit been used as part of the cellular concept, there is NO practicable way for such a circuit to be kept out of the public's hands. There are at present at least 10 active vendors who manufacture cellular telephone apparatus, and no doubt there will be more. Any `potential' vendor would have to be given encryption circuit details and be sold any integrated circuits designed for this purpose.

4. Had a digital encryption scheme been used so that each cellular

telephone had individual encryption keys, EACH receiving and transmitting site would have had to have a full database containing a unique cellular telephone identifier number and an encryption key. This same database would have to exist for hundreds and even thousands of sites - and be UPDATED. THIS is probably the single most important reason why encryption is not practicable at this time using the present cellular concept. (It would rather defeat the purpose of encryption if, say, the encryption key were transmitted in the clear prior to start of voice transmission, in case anyone thinks this is would eliminate a database requirement.)

5. Radio transmission is full-duplex, so that a monitor receiver would be able to hear only one side of the transmission. (Yes, I know one could use TWO monitor receivers, but how many people have that?)

6. Mobile/portable transmit power is LOW, and the ~900 Mhz frequencies are extremely line-of-sight in their propagation, thereby limiting the receiving range of a casual eavesdropper to only a few miles under most circumstances.

7. There are no identifier transmissions made between cellular telephones and base stations which would enable the casual listener - even if he could decode them - to learn the actual identity of the calling telephone.

8. Cellular channel assignment for working communications is random.

I am (timidly) entering the ham satellite area, and would like to begin
by listening to a few. I think I have all the right equipment, at
least according to the various books I've read (e.g. the ARRL Satellite
Experimenter's Handbook). I even have a super-duper tracking program
(in "real" life I'm an aero&astro professor at MIT, so THAT part is knid
of home to me). My problem now is: WHERE CAN I GET FRESH ELEMENTS?

A friend of mine subscribed to the AMSAT magazine that succeeded ORBIT
and tells me no fresh elements can be found there; I tried listening to
a supposed Wednesday 2100EST amateur satellite interest net on 3850MHz
with no luck (perhaps I have the wrong day -- the ARRL Manual says it's
on Tuesdays; unfortunately today is wednesday, so I would have to wait a
week to test that).

Can anybody suggest a source for fresh Keplerian elements for, say,
OSCAR-10 and RS-7?

Thanks, Antonio/KA1LLM

I see where the for/against ARRL debate has surfaced again.

Ralph, WA1ZCH is quite correct in that the ARRL is our only lobby. I'd hate to think where we would be today (if even on the air at all) without them.

Sure, I get upset with the League. They have pulled some real boners in the past, but nobody's perfect. I still think "incentive licensing" was the biggest fiasco in years (at least the way it was done). The League has given opinions and promoted ideas without surveying the membership for their feelings many times (remember no code?). BUT the FCC does listen to them and many great rules changes have occured because of the League. I am a life member but there are times I have thrown QST on the floor!

As far as magazines go, I think the ham magazines today are enough different to satisfy most everyone. It is too expensive to get them all (at least for me) but I do get QST and 73. We get HR at the club station here, and I occasionally grab a CQ off the newsstand.

At least with Wayne Green more or less gone, the editorial page battles have ceased.

Getting back to the League, If there are things you like/dislike about things, have you ever written to the ARRL or your division representative? Just like government, It's pretty hard for a representative to represent you if they don't know how you feel on a topic.

Another service to league members is that you can get copies of the NPRM's and stuff. I once wrote to the ARRL asking why they did not print all the dockets verbatum. Their answer was that there are not enough people that are interested. So they make all this stuff available on request.
This is the sad case - that a very minor percentage of us hams are interested in the FCC happenings, until something undesirable happens and we sit back and bitch about it. How would most of us find out about these happenings if it were not for W1AW!

Ralph also mentioned that some hams are technically oriented and some are

operators. I am more like Ralph. I seldom turn on the rig and just call "CQ". I am mostly at the bench working on a project of some kind.

Our local club has about 200 members. I would say that maybe 5 to 10 percent of the membership are technically oriented. (What really makes my day is when I hear a couple of the 75-80 year old hams who have been licensed for over 50 years compare notes on their latest gadget using 555 timers and such when they probably have trouble seeing the devices let alone understand all the state-of-the-art circuits today).

Bob, K9EUI

The ARRL Letter is published bi-weekly by the Information Services Department of the American Radio Relay League, 225 Main St., Newington, CT, 06111; (203) 666-1541. Larry E. Price, W4RA,

President; David Sumner, K1ZZ, Executive Vice President; Dave Newkirk, AK7M, Editor; Debra Chapor, Circulation Manager.

Information from The ARRL Letter may be reproduced in whole or part in any form including photoreproduction and electronic databanks, providing credit is given to The ARRL Letter and to the American Radio Relay League.

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds) per year for First-Class Mailing to the U.S., Canada, and Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

In this issue:

o Electronic Communications Privacy Act of 1985

o QCWA to File Comments

o ARRL Speaks on Auxiliary Operation

o ...and much more!

WE'LL SHARE 1900-2000 kHz WITH RADIOLOCATION: FCC

By FCC Report and Order released October 31, non-government radiolocation has been given primary status at 1900-2000 kHz. FCC believes this action in PR Docket 84-874 is a necessary prerequisite to future displacement of radiodetermination now at 1605-1705 kHz, a position ARRL disputes. A future proceeding will address possible expansion of standard broadcasting at 1605-1705 kHz in the Western Hemisphere. ARRL's fight against this reallocation had been in the works for many months; see Happenings, November 1984 QST. Effective December 9, 1985, amateur stations in the 1900-2000 kHz range must not cause harmful interference to the radiolocation services and are afforded no protection from interference arising from radiolocation operations. Though FCC will not accept applications from 1605-1705 kHz radiodetermination stations for moves to 160 until July 1, 1987, plans are afoot to allow new spread-spectrum radiolocation stations access to 1900-2000 kHz as early as December 9 of this year. FCC claims that amateurs will still have "virtually exclusive non-government use of 1900-2000 kHz until private radiolocation transmitters become operational." ARRL may file for reconsideration; watch the Letter for details. January QST will cover more of the 1900-2000 kHz reallocation and resultant changes to Part 97.

WHAT THE LEAGUE HAD TO SAY ON "AUXILIARY OPERATION 'EVERYWHERE'"

In the July 18 Letter, we detailed an FCC proposal (in PR Docket 85-215) to allow auxiliary operation on all amateur frequencies with the exception of 431-433 and 435-438 MHz. Auxiliary operation is defined in Part 97.3 of the Rules as "radio communication for remotely controlling other amateur radio stations, for automatically relaying the radio signals of other amateur radio stations in a system of stations, or for interconnecting with other amateur radio stations in a system of amateur radio stations." Currently, auxiliary operation is allowed only on frequencies above 220.5 MHz. Here are the highlights of the League's comments in 85-215.

The Quarter Century Wireless Association had petitioned FCC to delete the frequency restriction ("all amateur frequency bands above 220.5 MHz, except 431-435 and 435-438 MHz") from Part 97 because "the technological state of the art has made restrictions on auxiliary operation unnecessary." The League sees that the FCC proposal does not deal with spectrum management issues, however. How has technological development had any effect on the need to limit auxiliary operation to certain VHF and UHF frequencies? How will such expansion permit increased flexibility in auxiliary operations? It appears that the proposal would have the effect of shifting auxiliary operations to lower, more congested frequencies.

ARRL comments continue with a discussion of how crowding on the medium- and high-frequency bands makes them unsuitable for auxiliary operation, with the added headache of MF/HF propagation disallowing local frequency coordination of links on those frequencies. Many auxiliary operations, such as remote control of an HF station, require a high duty-cycle, which could only make interference worse in the more crowded bands. Why use long-haul frequencies for short-haul auxiliary links? 2 meters is another bad candidate for auxiliary work; it is fully loaded in many areas of the country. ARRL comments that the Commission is correct in protecting the weak-signal and satellite bands at 431-433 and 435-438 MHz, but similar segments should be protected on all bands.

For these reasons, ARRL has requested that the Commission not permit auxiliary operation on frequencies below 220.5 MHz, that Section 97.86 of the Rules not be modified as proposed, and that the proceeding be terminated without further action.

QCWA REQUESTS EXTENSION OF TIME TO FILE COMMENT IN DOCKET 85-215

The Quarter Century Wireless Association (QCWA), has asked FCC to extend the time in which to file comment in Docket 85-215 (see "What the League Had to Say . . . " above). QCWA said that detailed comment in 85-215 will require time-consuming analysis, and that the Association does not feel it can respond meaningfully within 30 days, and requests an extension of time to

file of 60 days. If granted, this would mean a new Reply Comment deadline of December 24, 1985.

NEW ORLEANS FCC DISTRICT OFFICE MOVES

Effective October 18, the new address for the New Orleans District office is 800 West Commerce, Room 505, New Orleans LA 70123; telephone 504-589-2095. Public inquiries concerning telecommunications matters, complaints of electronic interference and schedules of commercial radio operator examinations should be directed to this address.

1986 CHARGE FOR ARRL/VEC EXAMS

FCC announced on October 31 that effective January 1, 1986, the maximum allowable test fee will be $4.29 for a Volunteer-Examiner-administered Amateur Radio examination. The ARRL/VEC will charge $4.25 per candidate for tests taken in 1986 through Volunteer Examiner Teams working directly with the ARRL/VEC. The ARRL/VEC coordinates test sessions in all fifty states plus many locations overseas. Send an s.a.s.e. to Hq. for an updated printout of the test sessions in your area.

YOU CAN'T TAKE THE SAME TEST THE NEXT TIME

Effective November 8, FCC lifted Rule 97.26(h) requiring a candidate to wait thirty days before being retested on a failed exam element. The Commission now requires that a candidate being retested not take exactly the same test that was failed previously. FCC also directs that the VE Teams have the right not to retest anyone at the same session. Under the ARRL/VEC procedure, a candidate who fails may not be retested at the same test session. Once the candidate fails a written element, his or her participation at a session has ended. Subsequent retesting will occur only when the candidate submits a new Form 6l0 application and an additional test fee.

ARRL ON VEC MAINTENANCE OF EXAM QUESTION POOLS

If the Notice of Proposed Rulemaking in PR Docket 85-196 is adopted as proposed, Volunteer-Examiner Coordinators would be allowed to maintain their own question pools used to create examinations for amateur licenses. This maintenance is presently performed by the FCC, and VECs design written examinations by choosing questions from the FCC-issued pool.

ARRL adheres to the principle that the Commission, and not Volunteer-Examiner Coordinators, should retain responsibility for all Amateur Radio examination question pools. " . . . It appears that it was intended by Congress that the Commission should be

the entity which is responsible for maintenance of the question pools. It is questionable whether the delegation of authority to maintain question pools -- the most basic level of Commission supervision over examination quality -- is statutorially permitted . . . as recently as July 20, 1984, the Commission specifically clarified the rules to require 'that questions chosen for written examinations must be taken verbatim from FCC-approved lists.' Nothing has changed since then to moot that laudatory objective."

The opportunity for Commission review of questions submitted for inclusion in the question pool provides an undeniably beneficial filtering process for the varied type and quality of questions. Since FCC itself has stated that its maintenance of the pools is now mainly a custodial function, it cannot be argued that Commission maintenance of question pools is a significant regulatory burden. Assigning VECs the responsibility for maintaining question pools would be a step away from uniform standards and fairness; it would be a step toward allowing "shopping for the easiest examination."

The second proposal contained in the NPRM is the acceleration of the authority for Volunteer Examiners to design individual examinations for each examination element. While the preparation of individual examinations by VECs has worked out well, it is neither necessary nor desirable to permit individual examiners to prepare examinations from the question pools. If VEs are permitted to create the examinations, it would be possible for them to "teach to the test." VEs would not even have to divulge the contents of an upcoming examination -- they would be authorized to create the same. VECs must erect a "Chinese Wall" between
trainer and examiner functions. This principle would be impossible to enforce at the local club level. The advantage of the present system is that no one in the field knows the contents of a particular examination until shortly before the test date.

There is no unreasonable delay in obtaining examinations; there is an ample number of VECs to create them from the question pool. Paperwork is already time-consuming for Volunteer Examiners. Asking them to prepare examinations on top of this is more of a burden than is advisable. Overall, the League adheres to the principle that VECs, but not VEs, should be authorized to prepare individual examinations from the Commission-maintained question pool.

THE ELECTRONIC COMMUNICATIONS PRIVACY ACT OF 1985

As of mid-September, the Electronic Communications Privacy Act of 1985 (S. 1667 and H.R. 3378) is pending in Congress. The bill would amend Title 18 of the U.S. Code with respect to unlawful interception of wire and wireless electronic communication, authorizing the recovery of civil damages from and introducing stiff penalties for computer crimes and destructive "hacking." The intent is a broadening of the definitions both of protected communications ("any transmission of signs, signals,

writing, images, sounds, data or intelligence of any nature in whole or in part by a wire, radio, electromagnetic, or photoelectric system that affects foreign or interstate commerce") and prohibited practices. Licensed Amateur Radio and CB transmissions are listed among "unprotected" communications (students of double negatives will appreciate that interception of our transmissions would continue to be "not unlawful"), but the progress and evolution of the Act will bear close watching.

902-928 MHZ ACCESS ASKED FOR LOW-POWER VIDEO LINKS

Jerry Iggulden of Valencia, California, has petitioned the FCC for a rulemaking in amendment of Part 15 of the Commission's rules to allow unlicensed operation of low-power video transmitters at 902-928 MHz. "The rules and regulations currently don't allow for the non-licensed, low power transmission in any band suitable for video," Iggulden wrote in his September 11 petition. " . . . The proposed rule changes would allow for a video transmitter and receiver/converter operating at 902 to 928 MHz. It is the perception that these devices would serve the public interest by offering the benefit of broadcasting a video signal from the home video cassette recorder (VCR) to a TV in a remote location(s) (i.e., another room). It is virtually certain that the cost to the consumer for this benefit would be significantly less than a second VCR."

Iggulden, whose interest in the proposed rules changes is in "potential involvement with a company whose business would be to market the proposed devices," notes that the field strength presently allowed by the applicable subpart of Part 15 would be more than adequate for transmission over a short range or within a single-family dwelling. "In fact," he continues, "the Commission may wish to impose a lower field strength limit on the proposed devices in order to prevent interference problems.

What might this mean to amateur operations at 902 MHz? Iggulden's petition, designated as RM-5193 by FCC, appears to have been written without knowledge of the then-impending occupancy of 902-928 MHz by the Amateur Radio Service. Though our amateur allocation at 902 MHz is secondary, we're not secondary to the unlicensed emissions of devices operating under Part 15 -- so any such video links would have to suffer our interference and would be proscribed from interfering with us. And if you think that some of those second-harmonic cordless phone conversations polluting the low end of 80 meters are spicy, what of some of the video we might run into if low-power video links opened up at 902?

WA8AJN LICENSE SUSPENDED; REVOCATION PROCEEDING INITIATED

An Order to Show Cause and Suspension Order has been issued to J. Fred Riley, WA8AJN, of Kenova, West Virginia. Riley, an Extra Class licensee, is charged with violating Section 97.125 of the Amateur Rules -- the rule prohibiting "malicious interference," or jamming of radio communications of others.

Also alleged were violations of Sections 97.84 and 97.123, which are station identification rules. The Commission's September 23 Order requires Riley to show cause why his amateur station license should not be revoked and suspends his amateur operator license, based on these rule violations. Riley had 30 days to request a hearing or a written statement concerning the matter. His request for an extension of the reply period to October 31 was granted; no further news was available to press time.

YOUNG ASTRONAUT COUNCIL VOLUNTEERS SOUGHT

The Young Astronaut Council and ARRL are looking for radio amateur volunteers to provide space communications experiences for young people in YAC chapters around the nation. Think you're ready? Requirements for amateur volunteers are a willingness to devote a substantial amount of time to working with local chapters on a long term basis, and the ability to provide space communications activities such as OSCAR, earth-moon-earth and ham-in-space activities, including monitoring shuttle audio transmissions. Volunteers will be listed as resources in the Young Astronauts Program Chapter Leaders' handbook, and would be contacted directly by local chapter leaders seeking space communications activities. What say? Leave your phone number with the Development Office, ARRL Hq.

MARCE IN SPACE NEXT MONTH

The Marshall Amateur Radio Club Experiment (MARCE) will fly on space shuttle Mission STS-61C, scheduled for launch on December 18. The experiment will transmit telemetry in synthesized speech directly on 435.003 MHz FM and via AMSAT-OSCAR 10 relay on 145.972 MHz FM. Though the experiment may be audible mainly in the southern hemisphere, amateurs in the southern portion of the U.S. may have a shot at taking part in taping MARCE's telemetry. For more details, contact the Development Office, ARRL Hq.

INTERFERENCE FROM ULTRASONIC PEST CONTROL DEVICES

Ultrasonic pest control devices are advertised to repel pests (i.e., mice, rats, roaches, etc.) through the emission of acoustic noise that cannot be heard by people. These devices have been found to cause electromagnetic interference to televi sions, as well as other types of equipment. Frequencies at which interference has been reported range from 20 to 470 MHz. Though pest control devices are not normally subject to FCC controls, ultrasonic devices of this type are subject to the technical and noninterference requirements of Part 18 of the FCC Rules. FCC staff have determined that a minor technical change to ultrasonic pest control devices would substantially reduce their

electromagnetic emissions, hence reducing their RF interference potential. Additional information about this matter may be obtained by contacting Joe Husnay at (301) 725-1585 at the FCC Laboratory.

JOB OPENING IN DXCC

The DX Century Club Branch has an opening for an Assistant DXCC Manager. Primary responsibility is checking QSL cards and making proper DXCC record entries. The Assistant Manager is responsible for managing the DXCC Desk in the absence of the Manager. Applicants for this position should have a General Class (or higher) Amateur Radio license. A high degree of neatness and accuracy in record keeping is essential. Some interest in DXing and DX call signs helpful. Anyone interested in this position should contact Don Search, W3AZD, DXCC Branch Manager, ARRL Hq.

ARRL'S NEW REPEATER DIRECTORY EDITOR: BART J. JAHNKE, KB9NM

Bart comes to the Hq. staff from the Great State of Wisconsin. [He's also writing this -- Editor] He was born and raised near the city of Wausau (the other Insurance City) where his family still operates a 280-acre dairy farm. First licensed as KA9DLH in early 1979, rapid upgrades followed, and he now operates as Extra Class KB9NM [KB9 "Nature Man"]. Back in Wisconsin, Bart operated the VHF/UHF bands exclusively -- mainly on 144 MHz SSB and CW via tropo, meteor scatter, aurora, sporadic-E and EME, with those EME exploits having all been "on the horizon" with fixed-elevation long Yagis. Bart is also a VUCC Awards Manager. These days, Bart can be found below the horizon -- behind the stacks of CD-240 repeater registration cards and computer printouts in Membership Communications Services. [Editor's query: wouldn't EME from a dairy farm be earth-moo-earth?]

I recently acquired a brand new Shugart Type SA-901 eight-inch disk drive. My present Xerox 820-based packet radio bulletin board and message server runs two Shugart SA-800s. According to the SA-800 manual, the SA-901 will also be applicable to expand the PBBS storage capacity. My problem is I have no data providing the cardedge signals for the SA-901. Does anyone have the required pinout information? I'd be more than happy to photocopy same and return the material, pay postage, etc. OR, a simple listing would be sufficient! Am also looking for power supply requirements (specs). many thanks to whomever can supply this much needed info. Running out of disk space! >
It's just another BYTE. Recent ARRL "protection" stands are about as
serving to the amateur community as Jerry Pournelle is to the advancement
of computer science (read the recent analysis of the need for auxiliary
operation below 220MHz). We launched a letter writing campaign to QST
editors back in 1980 about the technical quality of the articles and even
suggest and volunteered to help with things like technical review of articles
and means for getting better technically qualified writers. The answer,
which was even more galling than just inaction, was that they felt that
they were doing a superlative job. Sure, that's why in the period of a
year we had an article on how to build a TouchTone decoder using 24 PLLs
(for those who don't know, there were chips to do that, albeit exensive...
$14. But if you were going to do it with discreet PLL chips, you can
you only need seven (there are only seven tones) and an article on a
microcomputer application for blind amateurs that sent numbers to them
as a slow series of beeps. Perhaps, some form of encoding (Morse?) would
be more appropriate.

Glad I didn't blow the bucks on a life membership.
-Ron

I have heard many things about FTP, especially for recieving
medium to large-sized files, such as the AX.25 level 2 protocol

specification or something large like that.

Could someone please tell me what FTP is and if (and how) I may
use it?

Thanks and 73's

I have recently been plagued with RF noise, which sounds like a 60 Hz buzz
with clicks superimposed. It is worst from 5 to 8 MHz, and is bothersome
from about 2 to 14 MHz. It is intermittent, but seems to be around
80% of the time.

I walked around my neighborhood with a receiver today and discovered
that it extends at least 4 or 5 houses in each direction on the street.
The noise level varied as I walked down the street. If placed my radio
against a street light pole (we have underground power here), the noise
was much stronger.

I would like to make this noise go away. Can I expect any help from
the power company or the FCC in tracking it down? Any ideas would
be appreciated.

Antonio,

    The nets meet on Tuesday nights. Our local net meets on wed
with the information from the previous nights nets. One of the principals
of that net on tues publishes a newsletter for Satellite info. Also, the
AMSAT org. is a good source of info. There is a document of some sort
that comes from NASA I think that publishes all sorts of satellite info.
I dont remember what the specifics are but I can ask at the next net nite.

Keywords: Passing encryption keys

It astonishes me how often the brash assertiveness of a posting
scales inversely with the knowledge and authority of the poster.
Comes now Larry Lippman, who says cellular speech encryption
could never work because a huge database of key pairs would have
to include every possible user/transaction. And don't try passing
keys before each transaction-- he's thought of that!

Has he heard of Diffie and Hellman? Shamir, Rivest and Adleman?
Oh.... Never mind....

Doug Maisel

All the reaction I've heard to the FRG-9600 has been strongly negative.
I was considering buying myself one until I saw the Icom R-7000. I think
it's worth waiting for (and paying more for).

Howard --

Sounds like a leaky underground power transformer; and
the lamppost is probably acting as an "RF probe" - extending
down to/connected closer to the source. That's why it's louder
when you get near it.

Call the electric company. They like to know when their xfmrs
are leaking. It means lost $$$ down the drain (or up in the
air - as the case may be). I know, in my neighborhood when one
of the pole transformers are leaking, it wipes out the AM band
on up.

It might be something else, but a transformer sounds likely.

73,

George

qst de k9eui
hr crrl bulletin nr 30 from crrl headquarters
london ont november 19, 1985
to all radio amateurs bt

doc has given crrl permission to release the following details of their proposal to restructure the canadian amateur service. there would be three amateur radio certificates. a. b and c.

certificate a would be entry level. candidates would be required to pass an examination on 1, the installation and operation of a modern amateur radio station, with heavy emphasis on preventing rf interference. 2, basic electronic theory, 3, antennas and propagation, and, 4, domestic and international regulations. there would be no morse code test. the following privileges and restrictions would apply, 1, the transmitter portion of the station would have to be commercially built. 2, no emissions below 30 mhz but all modes permitted above 30 mhz, 3, maximum power of 250 watts dc input. and. 4, could not become licensees of repeater or remote base stations.

certificate b would require a 12 wpm morse code sending and receiving test and holders would have certificate a privileges plus the use of all modes below 30 mhz.

certificate c would require a test on advanced electronic theory at a level of difficulty between the present amateur and advanced amateur examinations. holders would be permitted to operate homebuilt transmitting equipment, use 1000 watts dc input. and become licensees or repeaters of remote base stations.

further information will appear in december qst ar

qst de k9eui
hr propagation forecast bulletin 46 from arrl headquarters
newington ct november 18, 1985
to all radio amateurs bt

beginning in the middle of october and lasting through november 16, the solar flux was higher than at the same point in the previous solar rotation. after a november high of 86 on the 15th. the flux dropped to 79 by the 17th and 18th. visible activity on the sun was mostly in the western portion by this time so anything like the october high of 95 now seems unlikely this month. as this bulletin is being written, 21 mhz is full of life but 28 is almost quiet, a condition we will see often in the next two years or so.

except for low muf. propagation was fair to good after the first few days of november. geomagnetic disturbances were mostly mild. and they should have even lower intensity for the next nine days or so.

november 22 to 24 and 26 to 28 should be the best days, but fairly severe disturbances will close out the month. their effects will be most obvious on high latitude circuits.

during october and november, conditions were fairly typical of what would have been expected, with nearly two years left for a cycle of average length. deep lows like those earlier this year appear at seemingly random times in the late years of most cycles for which accurate records are available ar

I received my AIR-ROM for the Commodore 64 yesterday, and was up very late copying a variety of previously un-copiable RTTY stations. The AIR package seems to work pretty well. My only quibbles so far are that its Autostart is too stingy in my estimation, and that it doesn't seem to remember what Baudot speed had been set prior to going into ASCII mode. When you come back into Baudot mode, you need to reset the speed if you want something other than 60WPM.

However, I have now experienced having a computer in the ham shack for the first time. The C64 seems to produce incredible amounts of noise, which the receiver (an HQ-180) picks up over the entire spectrum (or at least the part that I listened to last night). I am looking for advice on how to quiet it down. Your personal experiences or references to QST articles would be much appreciated.

Thanks!! Bruce (K1FFX)

If this proposal goes through we will have a licensing structure that FORCES hams to be appliance operators. Furthermore, it would basically

kill the 'art' of QRP as one of the joys of QRP work is to build your rig.
This proposal will have to be killed!

The problem might be an old oil bunner. The older ones kept their
ignition on all the time and they radiate like crazy. Did the noise
only come on with the cold weather? using RF filters at the burner
would cure the trouble. I am sure the people with the bum burner have
the same rouble with their TVs and AM radios so would be interested in
cleaning it up if that is the problem.

I have recently had the opportunity to fix one of two problems
in my Kenwood TW-4000A, and thought the fix might be of interest.
```

Problem 1: On cold mornings, no transmit modulation evident.
Freeze-mist on the workbench could not duplicate the problem.
Solution: replace the gain and deviation pots with higher quality
units. The pots are very cheap in design, contacts (soldertails)
were crimped on, evidently loose, and would lose contact in cold
conditions. Freeze mist caused condensation which masked the problem.

Problem 2: Very infrequently, the microprocessor appears to go to
never-never land. Display is fluctuating meaningless characters, or
blank. No controls work, including PTT, beeper may sound. Resetting
the micro by power off/on seldom works. Resetting by shorting out the
reset contacts under the lower cover sometimes works. Removing
power for several hours always works (unplugging, not just turning off
the switch).

If anybody has info about problem 2, please reply.

Thanks and 73,
Chris Kelly, WD5IBS

Not to beat a dead horse, but remember that the Icom R-7000 has the same
bad design as the R-71, and other current Icom products, with a "dynamic"
chip requiring continuous power to maintain the radio's basic operating
system parameters and allow it to work at all. This means mandatory
maintenance (replacing the backup battery, either by expensive service
long after the warranty has expired, or by VERY CAREFUL self-maintenance)
every 7 or so years (fewer to be safe). I would treat that as enough
to disqualify the Icom from consideration either. It just doesn't strike
me that ANY of these new wide-band scanning/monitoring radios (Yaesu
FRG-9600, Icom R-7000, Regency M5000 or M7000, JIL SX-400, and whatever)
are worth buying now, especially for anything near their list prices.
In addition to the sort of design faults mentioned before, reviews

indicate that performance quality certainly doesn't seem to be good
enough to justify the prices. I would give the technology a few more
years of development before putting my money on it...

(If everybody realized this, and nobody bought these boxes, those remaining
would be dumped and might be worth buying at under-$100 prices, realizing
that you have to figure long-term high-maintenance costs in addition to the
initial purchase price. Of course, the manufacturers would have to be
told that these were not selling because they just were not good enough,
not that there was no market for such devices. Then they'd have an
incentive to continue R&D and come up with something better to supply
the market. Otherwise they would just abandon the field.)

Will

Keywords: antenna TS-430

Hi. I'm considering purchase of a TS-430s HF transciever and
was wondering what all the people on the net think about it.
Its very capable, reasonably priced and has a general coverage
reciever in it which appeals to me. Any suggestions on where to buy
it from?

Also, it'd be be plugged into an antenna on the roof of my
apartment building, and I'm relatively unsure what my manager will
let me put up there. My first thought would be to go
with an all band vertical like the HF6V, but there might be enough space
to put up a wire antenna as long as it didnt have to be too obstructive.
That way I wouldn't need a radial ground system that I gather most verticals
need in order to work well. The HF6V has a roof mounting kit option
with stub tuned radials, but I'm unclear how well it would
work out. I'm in the ground floor of a 2 story complex and

the view from the roof is pretty clear in all directions, so I should be able to get out fairly well from there. Any suggestions?

Thanks,
Milo Medin

PRANKSTER DISRUPTS RADIO BROADCASTS

Bob Parnass, AJ9S

CHICAGO - A pirate broadcaster has been treating Chi-
cago area radio listeners to some unscheduled program-
ming by transmitting on the microwave studio-to-
transmitter links of area AM radio stations.

The last incident, on November 21, involved the 'tap-
ping' of WMAQ-AM facilities. Listeners were assailed
with a barrage of cursing, and were treated to an old
Bob Dylan tune, 'Don't Think Twice'.

WMAQ-AM is the third Chicago station to report an
intrusion.

DIRECTOR/VICE DIRECTOR ELECTION RESULTS

The ARRL Committee of Tellers met November 20 in Newington to count ballots in the elections just concluded for Director and Vice Director. The number of votes credited to each candidate is as follows; the first listed candidate for each office is declared elected for the next term of office:

Atlantic Division, for Vice Director: James M. Mozley, W2BCH, 2857; Vince H. Bardsley, KB3OM, 2254.

Delta Division, for Vice Director: Lionel A. Oubre, K5DPG, 1246; Robert P. Schmidt, W5GHP, 656.

Great Lakes Division, for Vice Director: Allan L. Severson, AB8P, 3017; Carolyn S. Elliott, KA4JMZ, 1305.

Midwest Division, for Director: Paul Grauer, W0FIR, 1808; Robert S. McCaffrey, K0CY, 1075.

Midwest Division, for Vice Director: Richard W. Ridenour, KB0ZL, 1739; Dick L. Eilers, W0YZV, 1114.

Pacific Division, for Vice Director: Kip Edwards, W6SZN, 1301; Cynthia Delauney, W6PHT, 1061; Glenn E. Koropp, W6YFW, 612; Jettie B. Hill, W6RFF, 487.

Southeastern Division, for Director: Frank M. Butler, Jr., W4RH, 3777; Carl D. Henson, WB4ZNH, 1345.

The new Directors and Vice Directors take office starting January 1, 1986. On that date, the following candidates, previously declared elected (see the August 28 Letter), also take office for two-year terms:

Atlantic Division Director Hugh Turnbull, W3ABC; Dakota Division Director Tod Olson, K0TO, and Vice Director Howard Mark, W0OZC; Delta Division Director Clyde Hurlbert, W5CH; Great Lakes Division Director George S. Wilson, W4OYI; Pacific Division Director Rodney J. Stafford, KB6ZV; Southeastern Division Vice Director Evelyn Gauzens, W4WYR.

In separate elections held in Canada, Thomas J. Atkins, VE3CDM, was elected without opposition as President, CRRL, and Harry MacLean, VE3GRO, was reelected without opposition as Vice President, CRRL. They will serve, therefore, as Director and Vice Director, respectively, of the Canadian Division, ARRL.

RADIOLOCATION ON 160 METERS BY MID-DECEMBER?

On November 8, FCC issued an Erratum correcting a few

glitches in its Report and Order in PR Docket 84-874 -- the action making Amateur Radio secondary to radiolocation at 1900-2000 kHz as of December 9, 1985. The corrected Report and Order states that radiolocation stations displaced from 1605-1705 kHz would not be able to apply for 1900-2000 kHz operation until July 1, 1987, giving us "virtually exclusive" (FCC phrasing) use of 1900-2000 kHz until then. Well, our dictionaries vary a bit in their definitions of "virtual," but "giving the appearance of but not actually being in fact" is pretty close. And that's the way it is with our virtual exclusivity at 1900-2000 kHz: we may have company there very soon but it may be hard to tell when we do!

"Fine print" in the text accompanying the actual Part 97 amendment had said: "Also, wideband systems can be authorized immediately in the 1900-2000 kHz band since relocating displaced systems from the 1605-1705 kHz band will not begin until July 1, 1987." Wow! Would we really be sharing 1900-2000 kHz as early as December 9, the date the 84-874 Report and Order goes into effect? Hq. staff had a hard time believing their eyes, and asked for clarification.

Yes. The Erratum states that " . . . as stated in paragraph 25 [of the Report and Order], wideband systems can be authorized immediately in the 1900-2000 kHz band and need not wait until the dates indicated for existing and new radiolocation systems . . . applications for wideband systems in this
band will be accepted beginning December 15,
1985. The thought-provoking part of this is whether we may be able to detect aurally the presence of wide-band radiolocation if it arrives at 1900-2000 kHz. "Wideband" here means "spread-spectrum," and it remains to be seen if such a signal would rise much above the high atmospheric and man-made noise levels at most QTHs.

LEAGUE REQUESTS PARTIAL RECONSIDERATION IN 30-DAY RETEST ISSUE; REQUEST FOR STAY DENIED

Effective November 8, applicants failing exams for Amateur Radio licenses were no longer required by FCC to sit out a 30-day wait before retesting -- in fact, FCC made it clear that a waiting period of any length was not required at all. (See the September 30 Letter.) ARRL quickly filed a Request for Partial Reconsideration on the grounds detailed below, following this with a Request for Stay of the November 8 date of effect, pending Commission study of the request for reconsideration. The Request for Stay was denied; as this is written, we're 12 days into the "no waiting period" period. The serious questions raised by ARRL as to what may happen to the integrity of Amateur Radio licensing without a retest waiting period remain.

In its Request for Partial Reconsideration, ARRL notes that FCC's decision to delete the 30-day wait was based on three premises: that the waiting period was a carryover of what had been merely an FCC administrative expedient; that there is no persuasive evidence that any given waiting period will result in better preparation by an applicant; and that adequate protection

against a candidate possibly being retested with exactly the same set of questions -- "the only remaining concern" in the Commission's view -- is satisfied in that the Commission's instructions to VECs require that the same set of questions not be used in successive exam sessions. The League points out that these premises fail in several respects to justify the deletion of any waiting period, and fail expecially to take into account the integrity of the Novice examination program, which is not part of the Volunteer Examination program.

Here's the flaw: with the 30-day wait formerly on the books, anyone sitting for an exam, Novice Class or higher, had to wait 30 days before retesting if an exam was failed.
With the 30-day wait blown away, and with the integrity of the exam process guaranteed only by the prohibition against successive identical exams in the Commission's Instructions to VECs, Novice applicants appear to be able to be able to take and retake the same exam because Novice exams are not given by VECs! A loophole, indeed! Said ARRL, "Such an absence of regulations insuring the integrity of the Novice examination program will potentially affect the Technician license class as well. Ap plicants for the latter are credited with having passed elements 1(A) and 2, so that the beginner's code test and basic law examination need not be retaken."

Since the 30-wait prevented rote memorization as a side benefit, FCC's statement that the waiting period had been initially intended to conserve Commission resources is "not particularly relevant," wrote ARRL. "A waiting period approaching a month actually was not a burden on nor a reduction in flexibility of the VEC program. Quite the reverse: it was a benefit because it permitted a VEC to offer examinations on a more-frequent-than-monthly basis without the added burden of changing the examinations for each session. The waiting period limited the individual's ability to take the same test but facilitated the examiner's ability to offer a smaller number of tests more often to more, different people."

The League believes that the elimination of the waiting period will actually reduce the number of available examination sessions in a particular locality to at least that increment of time necessary to prepare new examinations. The public should not be deprived of an opportunity to take an examination once a week because someone had failed that examination a day or week before and the VEC was unable to supply all new examinations in time for a subsequent session. Practically speaking, the League believes that there are insufficient checks and balances in the VE system to permit reliance on the instructions to VECs not to use the same question set in successive examination sessions. It's noteworthy that the Commission retains a section in Part 13 of its Rules requiring that applicants for commercial radio operator examinations wait two months before retesting a failed exam element. Isn't what's good for the goose good for the gander?

"THE POINT YOU MAKE IS A GOOD ONE" -- FCC

Though the League's Request for Stay in Docket 85-21 was denied (see previous item),
FCC has agreed that the integrity of the Novice exam process may be adversely affected by the deletion of the requirement for a waiting period before retests. In a November 13 letter to the League's Counsel, Robert S. Foosaner, Chief of FCC's Private Radio Bureau, wrote:

"We appreciate your bringing the matter of the integrity of the Novice examination program to our attention. The point you make, that instructions to the VEC's concerning examination retakes do not apply to examiners in the Novice program, is a good one. We are correcting this omission by revising PR Bulletin 1035 A (Element 2 Examination Questions) to address this matter. Future editions of that bulletin will instruct a volunteer examiner giving Novice examinations not to use the same questions or the same telegraphy test when retesting an appplicant.

"The rule amendments in PR Docket No. 85-21 became effective on November 8, 1985. The matters that you raise concerning the subject Report and Order will be considered when the Commission acts on your Petition for Partial Reconsideration."

W0ORE/CHALLENGER VIDEO AVAILABLE FROM HQ

What was accomplished when Tony England, W0ORE, operated SAREX, the Shuttle Amateur Radio Experiment, aboard Challenger this past summer? The first ever television exchange with manned a orbiting spacecraft, that's what! You can watch as well as listen to the action with the new SAREX video, produced by Bill Pasternak, WA6ITF, with Roy Neal, K6DUE -- and it's available from Publication Sales at ARRL Hq. Postpaid prices are $25.00 for VHS format, $35.00 for U-Matic.

SCRRBA ASKS FCC FOR F8E EMISSION ABOVE 928 MHz

As we gained access to the 902-928 MHz band September 28 (see the Letter for August 15, and September QST), we were also granted use of an emission not allowed the Amateur Radio Service previously: F8E. That's "F" for frequency modulation, "8" for two or more channels containing analog information, and "E" for telephony. F8E is the emission used by stereophonic FM broadcasting stations, but its uses don't stop there. The Southern California Repeater and Remote Base Association thought that 902 MHz was a good place for Amateur Radio to make use of F8E, and suggested this as FCC was considering what privileges should be allowed amateurs on the new band. The request paid off; we were granted F8E on 902.

In late October, SCRRBA petitioned FCC to allow F8E on all amateur frequencies above 928 MHz for the same reason advanced by FCC in granting its use at 902-928 MHz: its availability would " . . . permit amateur operators to experiment with a new transmission mode and to efficiently utilize the spectrum when

several different channels of information must be transmitted simultaneously from one location to another."

Why not F8E on lower frequencies? SCRRBA considers them too heavily utilized for such a bandwidth-consumptive emission, excepting perhaps the 420-450 MHz band. Concerning 420, the Association said it would " . . . prefer to wait until a little operating experience with the mode is achieved before considering including the 70 centimeter band within the authorization."

FULL-CARRIER DOUBLE-SIDEBAND AM PHONE LIMITED TO 1500W PEP OUTPUT AFTER MAY 1990

On July 22, 1983, the FCC adopted a Report and Order in PR Docket 82-624 replacing the former input-power-measurement standard in the Amateur Radio Service with a power-measurement standard based on peak-envelope-power output, with 1500 watts being the maximum allowable power. The Commission recognized that this would have an impact on AM double-sideband full-carrier radiotelephone (A3E) operation, typically limiting such operations to half of their previous maximum allowable operating power. The FCC grandfathered the input power measurement rules for AM DSB operations until June 1, 1990, to minimize the immediate impact of this rule change. ARRL had gone on record as favoring permanent grandfathering of the A3E output limitation, but FCC's response was that " . . . we cannot justify a permanent and continous expense in terms of equipment and training that would be necessary for us to be prepared to make a special power measurement for this class of operations."

Glenn Baxter, K1MAN, fought this change for A3E all the way up to the U.S. Court of Appeals, and the judgment of that court was issued October 15. The U.S. Court of Appeals for the District of Columbia Circuit upheld FCC's decision, and its judgment was accompanied by an unpublished memorandum opinion.

In his appeal, Baxter had argued that the new standard, which permits A3E
operators to continue to operate under the old standard (1000 W DC input, the output power of which might approach 3000 watts peak), would decrease the range and quality of his operations, thus reducing the educational and economic value of his equipment. While the court acknowledged the importance of public service that Amateur Radio operators render, it could find nothing on the record to indicate that the Commission had violated its legal duties in this matter. It also concluded that the FCC possessed technical knowledge and expertise which exceeded that of the court. Baxter has indicated his intent to take his case to the Supreme Court.

[Editor's comment: Hq. receives a small but steady stream of "stamp out spectrum-gobbling AM" letters. We hope it's not out of place to point out that the emissions used by most amateurs between 1.8 and 30 MHz are amplitude-modulated emissions. Full-carrier double-sideband AM phone (A3E) is just one of several. By "doing away with AM," we'd be blowing away SSB (J3E) and CW (A1A) emissions as well. FCC estimated in its 82-624 Report and

Order that "only approximately one percent of the licensed amateur operators use this mode." As attrition runs its course, this figure can be expected to diminish further still. Aside from the question of spectrum usage, perhaps a hidden issue is whether or not every last radio amateur has completed his or her experimentation with full-carrier double-sideband amplitude-modulated radiotelephone, as the license each of us holds is as much a technological learner's permit as it is a pass to the amateur fraternity. So -- "do away with AM?" Never! What would we do without CW and SSB? And A3E? That's for you to decide.]

JOB OPENING AT HEADQUARTERS

The Field Services Department has an immediate opening for the key position of ARRL Convention Program Manager. This is a highly visible position in the field, with the Board of Directors and with the large number of ARRL convention and hamfest committees around the country. It's a "people" position for a "people" person. The ARRL Convention Program Manager oversees the entire Hq. convention support function, and supervises one ARRL Convention Assistant. The successful Convention Program Manager takes the initiative in
developing plans and programs to better serve crucial ARRL convention and hamfest personnel in the field, and streamlining Hq. functions to increase our internal efficiency in shipment preparation and prize/consignment packaging. Qualifications include high school plus one year additional education in office skills, including word-processing and data-base management. One to three years office experience required. An Amateur Radio license is desirable, but is not required. Starting salary: $15,496. Contact Richard Palm, K1CE, at ARRL Hq.

$40,000 OF ILLEGAL ELECTRONIC EQUIPMENT SEIZED BY FCC'S SAN FRANCISCO OFFICE

On October 8 and October 17, U.S. Marshals and FCC investigators seized an estimated $40,000 worth of electronic equipment, including illegal RF amplifiers and modified CB transceivers, from two Northern California CB sales outlets. Search warrants were executed against Doc Holiday Communications of Santa Clara and Red Money Communications of Fresno. Initially, these firms were issued warning letters for marketing illegal CB equipment. Subsequent to the warning, further investigation showed that both businesses were continuing to market or sell illegal equipment.

> ...

Digital speech encoding was not used in the cellular telephone concept for reasons of practicability including, but not limited to:

1. The cellular telephone design concept was considered to provide sufficient security to deter the casual listener using consumer-grade `scanners', antennas, etc.  No attempt was even considered to deter a `serious' listener who could spend many thousands of dollars for antenna towers, sophisticated receiving equipment, etc.

2. The cellular telephone concept was intended to be LOW cost and be capable of independent multi-vendor support. Therefore, hardware had to be as simple as possible without employing any one vendor's proprietary technology. While Motorola pretty much developed the cellular concept, they never did it from the standpoint of monopolizing the cellular market - such a monopoly never getting cellular telephones off the ground. While Motorola has also pioneered digital speech encryption using CVSD modulation in their DVP radio systems, this was mostly proprietary technology which Motorola was hardly going to share with the world.

3. Had a digital encryption circuit been used as part of the cellular concept, there is NO practicable way for such a circuit to be kept out of the public's hands. There are at present at least 10 active vendors who manufacture cellular telephone apparatus, and no doubt there will be more. Any `potential' vendor would have to be given encryption circuit details and be sold any integrated circuits designed for this purpose.

4. Had a digital encryption scheme been used so that each cellular telephone had individual encryption keys, EACH receiving and transmitting site would have had to have a full database containing a unique cellular telephone identifier number and an encryption key. This same database would have to exist for hundreds and even thousands of sites - and be UPDATED. THIS is probably the single most important reason why encryption is not practicable at this time using the present cellular concept. (It would rather defeat the purpose of encryption if, say, the encryption key were transmitted in the clear prior to start of voice transmission, in case anyone thinks this is would eliminate a database requirement.)

5. Radio transmission is full-duplex, so that a monitor receiver would be able to hear only one side of the transmission. (Yes, I know one could use TWO monitor receivers, but how many people have that?)

6. Mobile/portable transmit power is LOW, and the ~900 Mhz frequencies are extremely line-of-sight in their propagation, thereby limiting the receiving range of a casual eavesdropper to only a few miles under most circumstances.

7. There are no identifier transmissions made between cellular telephones and base stations which would enable the casual listener - even if he could decode them - to learn the actual identity of the calling telephone.

8. Cellular channel assignment for working communications is random.

Here are some interesting SW stations I have recently logged:

16474 USB Cruise ship "Norway" phone patches

18835 USB Comm test from Paris

17333 USB French Coastal marine station. Uses a musical
interlude as an identification aid.

17408.5 USB WECB, NOAA vessel "Mellville" working WWD
in La Jolla, CA.

5697 USB U.S. Coast Guard planes. Also use 6518.8, 6506.4,
6200, 8984, and 4430 kHz.

20873 LSB KFK92 Kitts Peak Observatory, Tuscon, AZ. working
another observatory, talking about lenses.

6100 AM Time sigs from Caracas, Venezuela

0.570 CW One per second time ticks with "RR" sent
on the 12th second.

7675 USB USAF traffic during shuttle launch

10295 TOR Interpol station CSJ25, Lisbon working ONA20
in Brussels

10494 USB FEMA net. test transmission ended at 1930z.

6683 USB Air Force 1

12000 AM VNG time sigs from Australia

8985 CW A4I sending tape "QSX 01/43/47"

9118 LSB Air Force 2

Travellers' Information Service
Radio Stations

Bob Parnass, AJ9S

Here is an updated version of the two lists posted last March. There are several new entries from the FCC 1985 Master File.

The federal government also maintains radio stations for this purpose, coordinating allocations through IRAC. Unfortunately, IRAC allocations are no longer divulged to the public.

SURE! And when the big, commercial interests petition the FCC
for ever-increasing segments of the amateur spectrum, you can
hire your own lawyer at $100/hour and up to argue your right
before the Commission to keep your HF, 2M, 220, et al. Jusst
how much spectrum do you think we'd have left if there were no
ARRL? Or do you recommend do-it-yourself law, too?

Can anyone comment on the performance (or lack thereof) of the new Heath
HD-1424 Active SWL Antenna (p. 6 of their most recent catalog)?

I live in an apartment and currently make do with a random-length long-
wire antenna on my SW receiver. (I don't transmit out of my apartment,
needless to say. :-})

< munch! gobble! chomp! chew! Why don't "THEY" fix this bug? >
 As an individual who is about to take the 5 wpm test and become a Novice
for the 1st time I am (understandably) interested in the tone of this
proposed license change and concerned about it's possible effect on the
format of Amateur licenses here in the US. It has long been proposed that
the FCC restructure the licenses so as to permit the operation of radio
equipment by individuals without Morse communications skills. The typical
hue and cry from the ARRL and the 'ranks has been; "What? then it'll be
just like CB radio out here! NO WAY!" ... this was what made me learn the
code. I've resigned myself to the fact that there is but one way to have
that ticket! As an aside, one of my friends asked a question, which I simply
couldnt answer: "Why don't they (the FCC) require a tough-technical exam,
and convey voice/data/etc privs. then if a person wanted to use A1,F1/etc
then require them to pass an exam on Morse code!" ...I couldnt answer him
because I was laughing too hard! (-|

qst de k9eui
hr propagation forecast bulletin nr 47 from arrl headquarters
newington ct november 25, 1985
to all radio amateurs bt

as predicted last week, propagation was about as good as we will see in the next two years or so, especially as to dx on 21, 24 and 28 mhz. though the solar flux dropped steadily from a high of 86 on november 15 to 74 on the 24th, geomagnetic activity was below average, making for strong, steady signals on all dx frequencies. activity on 28 mhz was mainly in the lower latitudes and on transequatorial paths, but 21 mhz was in fine shape. this band was very good to japan and the south pacific from the writers florida gulf coast site november 23 and 24.

another good break is likely november 26 and 27, followed by a generally poor spell from about the 29th to december 2. predicting the solar flux range for the latter period is risky indeed. the best guess is that the decline underway at bulletin time will bring flux values in the high 60s by about december 1. some upward movement is expected after december 2, but not as much as (garbled) half of november.

users of 28 and 50 mhz will find some interesting e skip activity during december and early january. this is the major e skip season in the southern hemisphere. we will catch some too, but nothing to equal what we experienced during our early summer ar

Excerpted from "Monitoring Times", Vol. 4, No. 12, Dec., 1985

"Recently, ICOM has endured substantial criticism in the hobby
press regarding the consequences of a failed lithium backup
battery for the RAM (random access memory) microprocessor circuitry.

It is true that if the battery fails (they normally last at
least five to seven years), the receiver will have to be sent
back to ICOM for reprogramming. The entire cost to the customer
is $25 including battery replacement, reprogramming, full check out,
and return postage. But some preventitive maintenance can avoid
the consequence entirely. . . ."

(The article then proceeds to tell how to use a 5 volt supply to
retain the contents of memory while replacing the battery)

Milo:
We are also a cliff dweller, and although restricted in what we might
put up, the advantage of having the building height makes up for some
of the limitations. In the past I have very successfully used a Hustler
4BTV trap vertical but I modified the feedpoint with a large brass disk to
accommodate many, many #12 wire radials. As in your situation, this is

somewhat unwieldy (don't want the super tripping over a spiderweb of wires!)
The use of a vertical antenna invites some TVI as the majaority of TV
feedlines are also vertical. I am presently using a simple end fed wire, well
insulated with glass and steatite at all points and fed against ground at
the point where it enters the shack. The ground is a steam pipe! I use heavy
2-inch wide braid to make the counterpoise connection.
It works quite nicely on all bands 80 through 10 with a simple L-tuner made
from an old ARC-5 (remeber those?) roller coil and a xmtg varaible. the proof
of the proverbial pudding is that I often run my Argonaut at abt two or three
watts output and am having a ball. this setup works especially well on amtor and
my neighbors have no tvi whatsoever! Good luck with whatever you finally
get going there. By the way, am thinking of extending my simple end fed and
creating a full wave loop out of it.

>chip requiring continuous power to maintain the radio's basic operating
>system parameters and allow it to work at all. This means mandatory
>maintenance (replacing the backup battery, either by expensive service

It seems to me that replacing a backup battery is hardly a difficult
job. I replaced the one performing the same function on my Azden PCS-3000
and it took all of 10 minutes. Big deal.

>In addition to the sort of design faults mentioned before, reviews

I would like to hear from someone who has tested the R-7000 since I
am considering buying one. A friend purchased an FRG-9600 for his
communications company, and the RF quality was so bad that they
sent it back. Anyone with good experience with this?

>indicate that performance quality certainly doesn't seem to be good
>enough to justify the prices. I would give the technology a few more
>(If everybody realized this, and nobody bought these boxes, those remaining

It is true that the R7000, the FRG9600, and the SX-400 (with adapters
to make it wide coverage) are a bit expensive, but they do an awful lot
compared to the $289 class of scanner. The MX-5000 & MX7000, purchased
from mail order houses, are so inexpensive that this comment is completely
wrong.

>told that these were not selling because they just were not good enough,
>not that there was no market for such devices. Then they'd have an
>incentive to continue R&D and come up with something better to supply

Or decide that high performance scanning receivers simply don't
have a high enough demand, and drop the whole idea. Remember the
Bearcat which had computer control? It was dropped because no one
bought it. The manufacturer then concluded that computer control was

I agree with you as far as packet users running more power than is
needed to accomplish satisfactory communication. However, the fact
that nearby packet stations are interfering with simplex users of
frequencies near designated packet frequencies is different. As is
the case with almost any new and powerful mode of communication that
comes into being in Amateur Radio, packet has been assigned simplex
frequencies that were previously used by amateurs for a club
frequency or just simple chatting.

A while ago, our club (the New Providence Amateur Radio Club) had our
base frequency on 145.800 MHz. As you may know, that frequency is now
in use by the Oscar-10 and related satellites. We were forced to move
just as the simplex users of the packet designated frequencies will
have to move sooner or later.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
One of the problems all packeteers are going to encounter is the lack
of publicity that has surrounded the coordinated packet channels. many
of the simplex phone ops I've spoken with have stated "I've never seen anything
in writing." Why not send a message to your SM or the League alerting them
aboutthis problem so we see more references to 145.01 through 145.09 in our pub-
lications?

Jim:
I wonder what you think of the Yaesu's QSK? Is it smooth? Does it
work well at 25 or 35 wpm? How do they accomplish it (keying relays,
solid state switching)? Also, I was wondering abt the built-in keyer; as
an afficianado of bug keying, I'm always somewhat surprised to see a built-in
keyer in a rig. Can you adjust the weight (dot-dash ratio). Is it self-compl-
eting, I wonder. Also, have you tried using the RS-232 programmability? Does
Yaesu offer any software or accessories that make use of the port? I do
appreciate your initial comments and would like to hear more. Many thanks,

Joe:
     We already have a no-code license up here in VE-land. It is
called the digital license and it seems to have been an unqualified
failure. It was intended to stimulate interest in digital communications
and in packet radio in particular but very few licenses were issued (only
a few hundred, and many of those, like myself, already had the advanced
amateur license anyway).
It consists of three parts. Two parts are the regulations and theory exams
that are also given on the advanced amateur exam. The third part replaced
the code exam and was a written exam on aspects of digital communications
with emphasis on packet radio.

Eric and Peter, I hardly know where to begin in answering your
question about the necessity for a code exam. except to say
that I have been a ham for 26 years and I can remember the issue
being as hotly debated when I started. The real answer as i see
it is that for some even the toughest technical exam is easy
because of professional training, more brain power or just being
still in school and practiced at studying. On the other hand,
a lot of potentially good hams would be screened out by such
tactThe technical exam should be (and is) just hard enough
to insure that new hams can handle the equipment without
danger or inconvenience to themselves or others and without
creating unnecessary interference with other radio services.
That part is tough enough for most. The code, in addition to
the obvious serves another purpose. It is a skill that one cannot
"cram" for. It is like learning to ride a bike or speak a
new language. It requires one to put in his time and there
is no real shortcut to its learning. It is a barrier which
tests ones determination to become licensed. In ham radio

we have a nearly century old proud tradition of community
service, self help and policing, strict adherence to the
FCC regs (no matter how arbitrary!) and a kind of "Can Do"
attitude which has served this country well in exchange
for the precious spectrum we borrow from it. The real
difference between us and CBers (it is foolish to
characterize them all as illiterate truckers) is that we
all had to WORK for our licenses and we CARE about the
hobby. We didn't just get a rig as an Xmas gift. I have been
giving the exams for just over a year now and I believe in the
system now more than ever for I see the people who pass and
those who fail. If you were in my place and with the power to
judge, you would probably fail a lot more of them! Of course
we do NOT have that power nor want it and we try to give
everyone every opportunity to pass. If as I believe we might,
the FCC bows to the pressure from within and without and
eliminates the CW requirement, it will be the beginning of
a process that will change Ham Radio beyond our recognition
and may even destroy it. In addition to all that, CW can be
very handy and (above about 25 or 30 wpm) useful and fun!
It may even save your life someday! Give it a try. 50,000
hams can't be all wrong! Thanks for wading throught this
wordy reply! 73 GL in your test! Bob K2SK >>

Rich:
hHaven't seen the heath active antenna unit yet, but have built very
small receiving antennas in the past, especially loops. The associated
amplifier was a six stage dc coupled broadband (video) amplifier. The
results were absolutely fantastic! I could hear as much on a three-ft.
diameter loop inside my apartment as with a G5RV located outside. To boot,
I was also able to null local man-made noise by rotating the loop. However,
what prompted me to answer your article was the fact you feel restrained
by cliff dwelling. You didn't say what floor you reside on, but my present
apartment QTH is on the third floor. I use a simple end-fed wire (black,
nearly invisible teflon #28) working against a steam pipe and fed via an
L-network using an ARC-5 roller coil. It's well insulated but close to
the stucture. Nevertheless, it works FB on all bands 80 through 10 meters.
I routinely use a Ten-Tec Argonaut At two or three watts and my log is
filled with QSOs on CW, AMTOR, and even SSB. When appropriate I run 125 watts,
but my neighbors rarely know when I'm xmtng. Good luck. I'd be curious to know
more abt your experienc with the Heath ant (or anyone else's).

hr arrl propagation forecast bulletin nr 48 from arrl headquarters
newington ct december 2, 1985
to all radio amateurs bt

september through november, normally a good time for hf dx in the northern hemisphere, provided almost textbook examples of the effects of solar activity on our dx bands. the september solar flux high was 73, and that on the first day. with an average of 69.5 the month was rough on the users of 21, 24 and 28 mhz. even 14 mhz was marginal most of the time.

early october was worse, with a flux average of 66.9 for the first 13 days, none of them above 69. funeral arrangements were being made for cycle 21, until it came alive on the 14th and the flux climbed steadily to 95 in the third week. the 21 mhz band was jumping by this time, and activity began to pick up on 24 and 28 mhz again.

november was quieter, but the flux was 75 or higher more than half of the time, reaching 86 at mid month. as predicted the last week of november brought low geomagnetic activity and exceptional signal levels on all frequencies (garble).

we enter december with the solar flux at 70, but with prospects for a gradual rise, peaking about the 12th. the area of the sun now facing earth has been giving us mostly good propagation, with only minor disturbances. the wwv k index should be watched closely this weekend and next. k values of 2 or lower particularly with a downward trend make for strong stable signals on high latitude paths. flux levels are not too critical at this season, except as they move into the low 70s or high 60s. even these low values will not wipe out 21 and 24 mhz entirely, but they limit 28 mhz coverage severely. the best of december is likely to be the 18th through the 24th.

watch 28 mhz and the vhf bands for signal bursts from the geminid meteors. peaking december 10 through 14, this is one of the more intense and reliable meteor showers. ar.

I have been told that recent changes in NICAD battery construction or materials has eliminated the memory effect problems. Is this true and if so, how recent were these changes?

Memory effect aside, it is still my experience that NICADS seem to be good for about 2-3 years at most. I am comparing my 10 year old Motorola H-T 200 to my present Kenwood 2500 which I have had since the middle of 1982. When I had the H-t 200, I used to leave the thing sit in the charger all the time with a 5ma current trickle on it. With the 2500, I charge it with the wall charger for 16 hours and take it off and do not charge it until the low battery indicator flashes. It seems to me that there has been no difference in life of these packs.

(Seen on AI2Q Packet Radio BBS in Freeport, LI)

There seems to be a new version of the Russian woodpecker operating on
20 meters! It is believed to be a new type of Russian over-the-horizon
radar and unlike earlier versions, seems to stay pretty much on 14 MHz.
The pulse-like noise is taking up approximately 30 kHz of spectrum.
There are 62 pulses per second and it sounds like a motor boat or a buzz
saw. It is a different type of sound entirely from the "woodpecker"
which is more like tapping.

The FCC has obtained some very good bearings on it and the fix seems to
be at 35 degrees 26 minutes north, and 27 degrees 2 minutes east. This
places it within a 1200-mile radius of Odessa, USSR, near the Black Sea.
The FCC case number of this is 85-WA295 and the Commission's Treaty
Division is in the process of lodging a complaint.

Alex--

The QSK on the Yaesu seemed to work fine. Contests are a time of
essential need for break-in, and we were running QRP with the rig,
too! I recall it was good.

Can't speak to your other questions as I'm not that familiar with
the rig's guts. About the keyer, we used my programmable keyer in
FD due to its obvious advantages in contests. My friend who owns
the 757 says the built-in keyer works OK, but the speed control is
VERY sensitive. And the keyer controls are not readily accessible
being on top and quite small. He's been using his own keyer, too.

If you want some more info, you might want to call my friend who owns
the 757. Give me a call at (619) 225-2665 and I can provide his name,
number, etc.

The rig seemed like a nice one to use. Having been a ham for over
20 years, however, I find it hard to wean myself away from peaking
the grid and dipping the plate!

I am considering getting into the ham-radio field as a hobby. My main reason
is that I would like to be able to communicate with a friend that lives in
Chicago (I live about 150 miles south of there) without paying ma-bells (MCI...)
expensive phone bills.

Since I know absolutely nothing about this area I am trying to gain some
information. What I specifically want is info on what magazines are good to
get, and also if my idea is in any way practical.

Please send this info by email, as I am sure that this sort of thing will be
very boring to most of you. I will post a summary if there is interest.

Thank you for any help.
         Achyutram Bhamidipaty.

As I recall, we are obligated by WARC to require a code test for
operation on the "low bands". This international treaty obligation
may be hard for the FCC to waive.

I don't believe that the obligation applies to 2-M and above, so
it is possible that a limited no-code ticket might be issued for
some limited set of bands (my advice: 220 and 1296), possibly for
data only.

US Radio Security Breached, Reagan Warned

from November 24, 1985
Chicago Sun-Times

Chris Chrystal

WASHINGTON - Drug traffickers and international terrorists can tune in to supposedly secret radio frequencies used by the Secret Service, the FBI and even Air Force One, two members of Congress said.

Sen. Dennis DeConcini (D-Ariz.) and Rep. Glenn L. English (D-Okla.) said thousands of radio frequencies were found among evidence seized in a Florida drug bust Sept. 13.

English described the frequencies - some top secret, including those used by President Reagan's airplane and limousine - as "a very serious breach of communications security."

He and DeConcini asked Reagan to call for a National Security Council investigation of radio security compromises, and to ask the Drug Enforcement Policy Board to review civilian law enforcement communications.

"We don't know how much of our intelligence community may be monitored," DeConicini said.

The list of exposed frequencies shows the United States has "lagged far behind in communications security," they said.

"The technology is there, but the emphasis by the administration is not," DeConcini said, adding that if communications security isn't tightened, the president's own safety could be jeopardized.

Scrambling radio transmissions, an effective security tool, is not widely done because of the need for agencies to share information while still protecting their own, DeConcini said.

In February, 1980, federal agents in New Orleans seized a motor home outfitted with scanners monitoring 250 channels. Some were being used to transmit information on drug enforcement activities.

Putting Ears to the Airwaves Rather Than the Ground

from November 11, 1985
New York Times

William J. Broad

Electronic eavesdropping - once the domain of Federal agents, foreign spies and a handful of amateurs with hours to spend tuning their ham radios - has come of age. Thanks to a new generation of sophisticated and often inexpensive hardare, the snoopers can sometimes be snooped upon, as two members of Congress disclosed last week in the case of a band of drug smugglers in Florida last month.

According to Federal agents, the gang had used the latest in off-the-shelf hardware and a knowledge of the Government's communications channels to keep track of law enforcement officers who were trying to keep track of them. Among the paraphernalia seized when investigators closed in was a 62-page list of transmission frequencies used by hundred of local, state, and Federal agencies, including the Customs Service, the Coast Guard and the Drug Enforcement Administration.....

.....Even the White House has reason to worry, according to Stewart Stogel, a television news technician in Mt. Vernon, N.Y., who spend his spare time scanning Federal frequencies with a ham receiver. He says he has tuned in on President Reagan's aircraft communications and eavedropped on unscrambled calls to Vice President Bush. On the day the President was shot in 1981, Mr. Stogel overheard a White House aide urging Mr. Bush to hurry back to Washington. The voice from Mr. Stogel's tape library advises, "The President is in surgery, and they're taking out the bullet." He said he once overheard the State Department privately helping Richard M. Nixon arrange a trip to Saudi Arabia.

Mr. Stogel added that one of his guides to knowing where to eavesdrop is something called the "Confidential Frequency List," a 304-page book sold for $15.95 by Gilfer Associates Inc. in Park Ridge, N.J.

Chief among the new snooping technologies is the computerized scanner. "Any housewife with $150 can go out and buy a scanner," said J. Michael Nye, a Hagerstown, Md. consultant who publishes a $75 guide called "Who, What, & Where in Communications Security." Scanners "quickly find radio traffic, so it's not like looking for a needle in a haystack," Mr. Nye said.

....[discussion of the vulnerability of mobile telephones]...

....The only way to insure confidentiality, according

to security experts, is to use scramblers and other encryption devices more frequently.....

"Most Government agencies are becoming aware that they're being monitored," said Rod O'Conner, an executive with the Motorola Government Electronics Group in Scottsdale, Ariz. "Rather than suddenly starting over from scratch, which would be enormously expensive, they're slowly changing over to secure equipment. It will take time, but this problem will largely take care of itself."

> failure.

Ohboyohboy...[rub hands with glee]...just what I've been waiting for,
a reopening of the old no-code debate!

I always find it amusing to compare the comments of those who oppose
the technical no-code license because it will create another CB out
of amateur radio with those who oppose the technical no-code license because
the Canadians tried it and nobody bothered to get one.

From what I've heard, knowledge of the code doesn't keep quite a few
people from jamming FM repeaters, but *lack* of knowledge of the code
DOES keep quite a few otherwise talented people from participating in
amateur packet radio development and other clearly worthwhile activites.

Sooner or later we *will* get a no-code "amateur" license in the USA.
The question is whether it will occur before or after the present amateur
service atrophies away from lack of both quality and quantity.
I much prefer the former over the latter, but you've got to have at least ONE
of those two factors to get and keep frequencies.

Phil

     IT SOUNDS LIKE YOU HAVE A CRYING NEED FOR A GOOD SERIES-TUNED LOOP
ANTENNA. I WOULD START WITH ABOUT 50 FEET OF LARGE DIAMETER CONDUCTOR
IN A LOOP. FEED THE "NEAR" END AND RETURN THE "FAR" END THROUGH A
WIDE-SPACED VARIABLE CAPACITOR-- ABOUT 50 PF. MAX. FOR 75 METER BAND.
~1800 PF. MICA CAPACITOR ACROSS THE FEED POINT WILL HELP THE MATCH.

          GOOD LUCK!

               JIM (W2OZH)

Correct me if I'm wrong, but I seem to remember reading somewhere that the
United States never signed the WARC treaty, so, as a result, the FCC can do
whatever they please.

>which is more like tapping.

So that's what that was! I heard it 10/28/85 at 1450-1501 UTC. It
was 20 over 9 in Phoenix, AZ, and covered the frequencies 14320-14344.
The edges of the signal were extremely sharp, going from S9+20 to
nothing an about 3 Khz. Other stations in the net in Detroit and
San Diego heard it at the same strength. Bearing for all was NE.

At the time I thought it was a military jammer, because it was clearly
designed to occupy a chunk of bandwidth, and because the ERP required to
cause S9+20 signals over 24 Khz over all of the US is enormous.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
Jeff, N6MNI, speaks the truth.
have been running a Ten-Tec Argonaut here over the past six years. Am
a cliff dweller so use a "Cliff Dweller's Special" hidden end-fed antenna
which runs from the bedroom where the shack is, out to the fire escape, and
thenacross the roof. results are absolutely fantastic! Can't tell you how many
really fine CW and SSB QSOs I've had. The most amazing operation, however, is

on AMTOR with a Model 100 lap-portable CMOS machine and a kantronics
8039-based "universal" T.U. So far have had FB error-free ragchews with forty
states and five countries. have DXCC worked with the lil Argo on CW also
(not confirmed, but they're in the logbook). We also work QRP Field Day
every year with N2RI and KQ2G. It's amazing how we do. Of course, for FD
we put up a Bobtail curtain, phased wire arrays on 20, and extended Zepps
on 80 and 40. Ade Weiss' Milliwatt trophy is to be supported!!

There is a Kenwood User's group in florida which has published a
newsletter for 5 years or so now. I have early versions, covering
up to the 930 introduction. If the 7930 would be in this era, would
be glad to look. If not, you might contact them, and see if they
have any info on this problem. When I last called them, they wanted
to know if i was a member before discussing problems at length, but
they have a net on saturdays which should be "free" access to
information. My experience with calling kenwood service directly
indicates that if they have seen this problem before, they can
probably tell you over the phone the fix, or send a tech bulletin
describing the fix. I have done both with the ts830 and its
infamous "frequency shifting" due to a poor ground on one of the
boards.

He doesn't know what beverages are? Why, they are things that you drink!

There is a technical term also -- a Beverage antenna is a long, low,
highly directional traveling wave antenna.

According to the ARRL Antenna Handbook, anything over one wavelength is
effective, but the directionality and gain will improve if you make it
longer. A height of 10 to 20 feet above ground is about right. The far
end (in the favored direction) should be terminated in a resistor which should
ideally be equal to the characteristic impedance of the antenna, which acts
like an unbalanced transmission line. The ARRL book says 500 to 600 ohms is a
typical impedance. At the feedpoint, a matching network is needed to match
the 500 - 600 ohms to the feed line. Or else open wire line of this impedance
can be used to bring the signal to the receiver, but then a matching network
may be needed at that point.

The Beverage antenna is said to be very effective for DX reception from a
single direction. If you use it for transmitting, half the power is lost in
the terminating resistor, but you do get gain and directivity.

Having never used one, that's about all I know about it.

73,
John S., W3IKG

Listening to everyone knocking the quality of ICOM gear, I would like to add a few comments about Kenwood equipment, particularly since the discussion so far gives the impression that Kenwood quality control is much better than ICOM.

I would start by stating that I like Kenwood HF gear. I own both a 930 and an 820 and I feel they both give excellent value. Nevertheless, the problems I've had are due entirely to carelessness on the Kenwood assembly line. My 820 developed a problem with its digital display when it was five years old that turned out to be unsoldered (not poorly soldered) connections on a PC board. Similarly, when the meter on my 930 ceased functioning, the problem was an unsoldered connection. In this case, however, there was solder on the meter lug only it was not where the wire was attached. A good friend of mine, W2AZX, has a 530 which failed to work properly out of the box (apparently they didn't even bother to try it out at the factory). Here the problem was the failure to insert one of the leads on a resistor into its hole in the PC board. All three of these problems could have been eliminated with a little more care during manufacturing.

ICOM certainly does not have a monoply on poor quality. Furthermore, Kenwood problems would appear from my limited experience to be not with their parts suppliers but rather with themselves.

qst de k9eui
hr dx bulletin nr 41 from arrl headquarters
newington ct october 18, 1985
to all radio amateurs bt

thanks to k1xm, w1trc and the southern new england dx association for the following dx information.

sao tome. a west german group has been very active from sao tome, using the callsigns dj9on/s9 and dk9kx/s9. they have been on daily, on 14195 khz listening between 14200 and 14215 khz at 2100z, on 7001 khz from 2200z on, on 21025 khz at 1300z and on 3501 khz at 0001z.

kerguelen. ft8xa and ft8xb have been active on 7008 khz at 0130 and 1100z. also, ft8xb has been on 3795 khz from 0100 to 0130z.

uganda. 5x5gk has been on 21358 khz at 1830z. qsl to dj5rt.

diego garcia. vq9yr has been worked on 14257 khz at 1900z.

st. helena. zd7xy, a yl, has been active on 14214 khz at 1900z.

rwanda. 9x5wp has been active on 14219 khz at 2000z.

comoros. d68wb has been on 14257 khz at 1900z.

guinea bissau. j5wad has been worked on ssb on 14209 khz at 2100z and has also been active on 7045 khz.

chad. n7df/tt8 is rumored to be active on 1830 khz at 0220z. his signals have been extremely weak in new england.

galapagos. a group is going to galapagos and plans to begin operation on october 22 on all bands, 160 through 6 meters. operation will be mostly cw and rtty until the contest begins on the 26th. each participant will sign his own call /hc8. during the contest the call hc8x will be used. on their way home, some of the group will operate from the ecuadorian mainland. qsl hc8x to k8cw. qsl the american amateurs to their own callbook addresses.

4u1itu. k4iif plans to operate 4u1itu on all bands during the

cq ww contest. qsls go to leo haijsman, w4ka, 1044 se 43rd st., cape coral, fl 33904 ar

For Sale: Ham Radio Station

PRICE SLASHED (again!)

Icom IC-720A transceiver with narrow CW filter
Icom PS-15 power supply
Icom IC-SM5 desk microphone
Icom hand-held microphone (not used for mobile operation)
Hustler vertical antenna (80, 40, 20, 15, 10 meters)

The transceiver is in very good condition and has never been used for mobile operation.

You can have the whole package for $700.00 plus shipping (if you're in reasonable driving distance I'll drive it over).

Call me at 312-231-6054 (Mon - Fri, 8:30am - 4:30 pm CST) or 312-852-1271 (Mon - Fri, 5:30 pm - 10:00 pm CST, or all day on weekends).

I definitely think that amateur radio is a good way to communicate with your friend in India. 80, 40, and 20 meter bands should easily offer you the frequencies to do just that. I just recently obtained my Technician class license after letting my General license expire many years ago, and one of my intentions is to be able to talk to other countries.

A good way to begin is to buy some of the ARRL license manuals and radio handbooks and some of the monthly magazines like QST, Ham Radio, etc. These documents will give you a feel for the events, equipment, and requirements for licensing. You can also find most of these items in local libraries too.

By the way, I am a Sales Eng. for Hewlett Packard here in St. Louis. What are you busy pursuing in the San Francisco area? Also, if I can provide further assistance on your Ham endeavors, please let me know.

Jim

Indeed, I have been experiencing a frying/popping noise in the transmit audio
on my TR-2500, most likely very similar to Bob, K9EUI's noise on his 7930/7950.
I have ripped out way too much circuitry for such a "simple" problem, but it
still hasn't gone away. The noise appears only intermittently, and never has
it been > 1 KHz deviation. So I live with it.

Since we're discussing rigs, I'd like to put in a strong plug for Ten Tec. I
have owned both the Triton 4 and now the Corsair and I have never had ANY
problems with the rigs - NEVER! OK, the Corsair doesn't have a general
coverage RX, or as many spiffy features as the Kenwood TS-940S, but as far as
I can tell, the Corsair is a superior CW rig compared with the '940, although
on SSB the 940 has an edge with all of its bells & whistles. I chose Ten Tec
because of all the HF rigs I was looking at at the time, only Ten Tec gear
looked like it could be fixed by an average ham...Peek into one of those
other HF rigs & say something nice about serviceability!

-Mike, K3MC

Probably the reference to Beverages is to a beverage antenna. It is
usually used in low freq ranges, is a coupld of wavelengths long and
low to the ground and terminated. Provides some directional characteristics
gain and reduced noise. You need lots of room although I do remember seeing
an article by a Pacific ham who used a short variation on 40 meters to
communicate back to the states. He oriented the antenna to knock out a
broadcast station in Japan or so. The claim was effective for the money
involved.

Summary:

I too think that it is important for us hams to get out and do some public
service once in a while. I have worked the Portland Rose Parade several
years and had a blast doing it. Sometimes we had jerks for net control
and post operators, but better to learn how to make a net successful when
its all for fun rather than when its for lives. Besides, if you plan a
mass pizza party afterwards, it makes for even more fun...

I fear we seem to be helpless at stoping this system from devoring us.
President Regean said he was against stoping the red ink if it cut's into
the Star Wars project. What's the sense in this madness?

Yet another tear shed for our lost liberty. I wish my county loved us
as much as we love it.

Anyone needing San Marino on CW should check 20 or 15 meters on
weekends, between 1500 and 1700 UTC. I have heard him on
consistently on weekends, roughly between 20 and 30 KHz up on the cw
band. He QSL's very fast if you go direct with a green stamp.

One problem that I have encountered is interference from older cordless
phones on the ham bands. There are some that do operate in the 160 meter
band, although they are in the minority. last week I heard two cordless
phones in the 30 meter band! Turns out that it was the 6th harmonic and
both were S-9 signals.

I don't know what can be done about this situation. I am sure that people
would not willingly junk their phone just because it interferes with a ham.
Has anyone else had experience with this type of interference or know what
the FCC's reaction is? In the last few cases of interference to the amateur
service I have had (caused by commercial transmitters) the FCC wanted us
to solve the problem.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
Hi Jim:
The term is a proper noun as it is the name of an antenna named after an
engineer called Beverage. The antenna is very long, highly directive,
exhibits exceptional gain, and is noted for its low height above ground.
Beverage antennas are often used by serious longwave and 160 meter
enthusiasts. You do have to be careful however so you don't trip over
then while out inspecting the antenna farm. They're usuallly only a few
feet above the ground and, by the way, work best over sandy or rocky
terrain. I have detailed info here somewhere; let me know if you want
more poop. Until then, very 73 de Alex, AI2Q, Freeport, Long Island >>AR>>

My favorite antenna for general tuning around on VLF, LF and HF is an active whip antenna (untuned). It is basically a J-FET follower direct coupled into a PNP. My whip is about 3 feet long (anything much longer and I get broadcast overload).

I once tried a large untuned shielded loop by throwing a length of RG-58 coax over the house roof. The ends were brought in a window and properly connected to the rcvr. This antenna worked quite well, too.

Could the noises be the same old "Kenwood Crunchies" that used to plague the TR-2400? As I recall, this was caused by the PC board to chassis ground becoming intermittent. Tightening up the PC board mounting screws and maybe soldering one of them in place cured the problem. Putting a lockwasher under one of them would seem a less drastic way of ensuring good contact.

I hope it's that easy.

hr arrl bulletin nr 92 from arrl headquarters
newington ct october 21, 1985
to all radio amateurs bt

this is a correction to arrl bulletin nr 91. the federal communications commission announces an agreement effective october 14 with the united kingdom department of trade and industry to permit third party communications between amateurs in the united states and special events stations in the uk having the prefix gb only, except that gb3 stations are not included. three conditions apply. (a). communications are limited to conversations or messages of a technical or personal nature too unimportant for a commercial message. (b). no compensation direct or indirect. (c). communications must accord with regulations for amateurs in each country. note that agreement applies only to gb stations other than gb3 ar

qst de k9eui
hr propagation forecast bulletin nr 42 from arrl headquarters newington ct october 21, 1985
to all radio amateurs bt

in a special midweek bulletin we reported a solar flux rise that began october 13. from 67 it rose to 80 by the 20th, the highest flux reading since early july. the 21 mhz band has been open over much of the world in the past few days, and 10 meter beacons z21and and zs6pw have been heard in northern usa for the first time in more than a year. over the past weekend 10 meter occupancy was the highest in many months.

as of sunday night we were coming out of a week of generally poor conditions, the result of above average geomagnetic field activity. things should improve october 21 through 23, but absorption and fading will be bad again october 26 to 30. another major disturbance is expected early in november.

the main source of the higher solar flux is a fairly large spot area that came around the east limb october 15. its influence will decline as it moves westward this week, and the flux will

slide downward if, as seems likely, no major new areas replace it. the main propagation factor for the next few days however will be magnetic field activity. the a index is low as this is written and it is dropping lower, but not for long. there should be a longer favorable period later this week, but a major disturbance will be with us by november 1. we are in the best weeks of the entire year for propagation in the northern hemisphere, in any case, and with enough solar activity to keep things interesting through this week.

american sunspot numbers for october 10 to 16 were between 0 and 17 with a mean of 4.3 ar

Having tinkered a bit with 2-meter packet, I am now interested in going HF.
However, a bit of information would be helpful to me:
(1) Does everyone on HF run 300bd? Is it 103 modem tones?
(2) What hacks do I need to make to my HD-4040 (Heath TAPR clone) in order to set it up for HF.
(3) What are good HF frequencies to operate on? How about gateways, BBS'?

Any information would be helpful.
Facts are even more useful.

During the Mexico City earthquake disaster, we tried to get a Kantronix packet interface going in Mexico City for health and welfare traffic. Unfortunately, during the short time we had to test it, we couldn't get it to receive anything. The manual was singularly uninformative about troubleshooting. It appears that the FSK work is all done by a magic chip which has no description in the book and a custom part number. We couldn't find any pin that appeared to have the FSK demodulator output.

Does anyone know how to tune this beast up with a scope, rather than just using the frequency counts? Does this thing work? Is it any good? Does anyone at Kantronix know how to write a technical manual?

+++FLAME ON+++
We wasted several hours of valuable disaster net time due to the sorrowful documentation on this product!
+++FLAME OFF+++

What should I tell Carlos (XE1HC)? Should he throw the thing away or is there a rational way to get it to work?

VERON Jubilee Spacelab Propagation Experiment.

Introduction.

The flight schedule for the next Space Shuttle with the three astronauts/radio-hams on board is still at 30 October 17.00 UT
The dutch VERON propagation experiment,carried out by Wubbo Ockels PE1LFO,is incorporated in the german operational working modes.

Experiment in short on 145.575 MHz.

In a 2 mtr FM propagation experiment,(145.575 MHz),Wubbo Ockels PE1LFO in the Spacelab will transmit an unique series of codewords,with regular intervals, transmitting each 15 sec a new code of three letters from the intern. spelling-alphabet.
The position of Spacelab each time,is fixed with spacings of approx. 100 Km.
Radio-amateurs on earth will only listen and hopefully they will report as many codewords as they have heard plus their own IARU gridlocator.The elaboration reports will give a picture of the propagation in the used communication-channel.
Reports will be confirmed with a special VERON-QSL card.

Reporting.

The observation reports of the experiments correspond with the normal reports in the radio-amateurs logbook,but instead of one line per station there is now one line per code.
Please report your observation as follows:

Nr. Date,Time(UT/GMT),Receiving code,RST,Freq/QRG and remarks.

Also of very importance is the data of the receiving station,like call,name, address,receiver description,antenna used and the IARU grid-locator.

Please send your logbook to:

VERON Space Experiment or Veron Space Experiment
B.C. Caron PE0BCC Dutch QSL Bureau
Colijnlaan 11 P.O. Box 330
NL 2181 XJ Hillegom NL 6800 AH Arnhem
The Netherlands The Netherlands.

Trajectory.

We hope, the Veron experiment will be executed once or twice in a 20 minute trajectory from New Foundland,West-Europe,The Netherlands to the Middle East.
Another route is Mid Atlantic,Azores,West-Europe,The Netherlands to Russia.
The orbits are such that between 09.00 and 20.00 UT,there are six more or less favourable trajectories over Western Europe.
The lauch at Cape Kennedy at 17.00 UT corresponds with an equator crossing at 16h 55m 44s UT at 261.269 degrees East.
Orbit alt. 324 Km,inclination 57 degrees,period 1h 30m 57.3 sec.

More information will be given by:

.....As the proud owner of a Kenwood TR-7950 I have experienced several intermittent type problems, most of which I believe I have permanently fixed. It would be interesting to see if other people have experienced identical failures:

1) All of a sudden, the transmit power (which is displayed by a bar of LEDs) drops from a full set of LEDs (7 I believe) to one or two which flicker. The hi-lo power switch has no effect. The antenna VSWR was checked and this was not changing. Smacking the radio brought back a full set of LEDs and also full output power on an inline wattmeter. After tapping on the transmit board with a non-metallic diddle stick and unplugging and plugging several pc board connectors, and checking the RF drive to the final amp with a scope and also the hi-lo switch logic, it was determined that the problem was poor grounding of the final amplifier board to the aluminum heat sink. Scraping some flux residue away from the mounting hole locations and also scraping the contact area of the cast mounting bosses for the final amp board has cleared up the problem, hopefully forever.

2) When the radio is just sitting there, turned on, squelched receive mode, without the automobile engine running, scratchy noise comes and goes from the speaker. The sound is like someone turning a dirty volume pot back and forth. This problem was cleared up by playing with all of the connectors when looking for problem 1. It has not occured since.

3) When transmitting, the people listening at the other end would complain of haering my first few words loud and clear, and then my audio would fade out to about 30 percent in about three or four seconds. DTMF tones would also fade out and become distorted and unusable for an autopatch. Again, this problem has not occured since looking for problem 1.

All three problems used to come and go independently, which made things difficult. They all occured within six months of being a new set. I did not send it to the factory for repair since I already felt guilty for buying a ready made store bought set, never mind not trying to fix the problem myself first. (That's what ham radio is all about, isn't it?) All systems are GO now, and I would be curious to hear if others have had the same problems.

P.S. I just remembered, when first looking at the rear heat sink assembly, there is a strange phillips screw about 1 to 2 inches long, screwed in from the rear of the heat sink. The shaft of this screw is threaded for only about a half inch and the rest of the length is smooth.

On the inside of the radio a solid wire, #16 I believe, soldered at the DC power connector minus terminal, was just WRAPPED around this smooth screw, obviously trying to provide a ground from the DC power connector to the heat sink assembly. This wire was promptly soldered to the screw, but it did not seem to make any difference when searching out the problem in #1 above. I assumed that somone forgot to solder this solid wire at the factory. Maybe they did not want it soldered, by I can see no reason why.

Speaking of Azden PCS 2000s; (I know, you'd rather not)
I discovered a peculiar problem with mine that I'd like
help in tracing down.

A couple of weeks ago when the meteor-scatter packet-radio
experiment was proposed during the Giacobini Zinner (sp?)
pass-by I tried to set my station up on 145.09 to participate.
I noticed a large amount of activity on the channel. Closer
monitoring revealed that I was in fact still on 145.01.

I switched back and forth several times to verify this and
found it to be, sadly, the truth. I have never noticed any
other abnormalities in the tuning of the rig and don't know,
offhand, how to ferret out the problem. Anybody have any
suggestions?

73 de Ron, WA2EYC

PS: Sorry if you get this twice but I have posted it to both

Other possibilities for excessive crunchy noise are bad transistors (high
1/f or "flicker" noise), electrolytics installed with wrong polarity, or just
bad electrolytics (usually the reversed ones come back to life if installed
properly), or DC running through the wiper arm of a pot. The latter condition
can be caused by leaking electrolytics, by the way. Also loose connectors,
dirty transistor sockets, or dirty switch contacts.

I know, soak the whole radio in a sulphuric acid bath for about 24 hours, and
I guarantee you the noise will be the least of your problems.

Hot off the presses (or perhaps just reinvented):

We at the MITRE-Bedford Amateur Radio Club (MBARC) wanted to feed a 160-meter half-wave at the end supported by our tower, to avoid draping feed lines across a parking area. We came up with the following scheme, which can be adapted to other bands by the obvious scaling of dimensions.

We observed that an end-fed antenna exhibits a high impedance, which our antenna gurus here at MITRE say should be maybe 1200 to 1800 ohms, and of course it would be purely resistive if the antenna is exactly resonant. The exact resistance depends on height above ground and other factors. Anyway, we noted that a quarter wave transformer to match 1800 ohms to 50 ohms needs to have a characteristic impedance of exactly 300 ohms. (In general, the square root of the product of the given impedance and the desired impedance.) So we made up a special cable consisting of a convenient length of RG-8/U soldered to a quarter wavelength of "Radio Shack's Finest" black foam-filled TV twinlead, which incidentally, I have had good luck with even when running the full legal limit through it at high VSWRs. The hot side went to the end of the half-wave antenna and the "ground" side we connected via a water-pipe ground clamp to a cross leg of our Rohn tower. We figured that at 160 meters this was more or less "ground". Purists would want to add a 1:1 balun at the coax-to-twinlead junction, I suppose.

We fired the thing up and voila! a match of 1.5 to 1 or better was had over much of the 160-meter band, though it did get up to 3:1 at 2 MHz. Presumably this could be tweaked in to cover the band segment of interest, and of course it would work fine with a tuner even at 3:1. Signal reports have been outstanding.

In summary, a quarter wave transformer made of 300 ohm twinlead seems to work well as a matching network for end-feeding a half-wave antenna. A balun between the coax and the twinlead appears to be unnecessary. Soldering the twinlead directly to the coax and covering the joint with a heavy wrap of electrical tape makes a mechanically satisfactory connection, though shrink tubing (I like to call it psychiatrist tubing) would doubtless be more permanent. Take care to connect the twinlead correctly so that the coax shield goes to ground and the coax center lead goes to the antenna. Of course if you use a balun this is not a concern. Hint: Crimp-on "butt" connectors seem to work well for attaching more durable wires to the fragile #20 or whatever is in the twinlead.

If you use this idea, take care to keep the twin lead away from metal objects as much as possible. We used rope tied around the twinlead to support the top end, and rope to support it clear of metal objects at the bottom end just before the coax. Twinlead is not as strong as coax and should not be subjected to unnecessary tension.

One final note: The antenna ought to work reasonably well also at half the design frequency, with maybe a 2:1 VSWR, easily handled with a tuner.

In article <2188@brl-tgr.ARPA> jhs@mitre-bedford.ARPA writes:
>Incidentally, I have found that people recognize the term "ham radio" as
>something different than CB, whereas the seemingly more dignified "Amateur
>Radio" is more often confused with CB or perhaps pirate broadcasting.
>I was pleased to note that the newscasters IMMEDIATELY mentioned ham radio
>as a possible link to Mexico City after the recent earthquake. We are getting
>some serious recognition these days, usually under the name "ham radio".

I strongly agree! We must use the term "ham radio" (or radio afficionados - sp)
if we want the public to know who we are. The term "amateur" is presumably
used to indicate "not an avocation", but most folks interpret it as
"incompetent". So unless we want to be known as "incompetent radio operators"
we should use another term.

>
>A final plug: All you hams out there in Net-land please consider your
>responsibility to do at least a little public service work from time to time.

Even if you don't get satisfaction out of these activities (and they are
usually lots of fun), you should recognize that our $500 BILLION worth
of spectrum is justified to a large extent by our public service and
emergency activities. Ignoring these responsibilities means that the
next time someone wants to ban our antennas or snatch our frequencies
or impose quiet hours, we don't have much of an argument. DXing or rag-chewing
or experimenting do not by themselves justify the priviledges that we have.

I also recommend that if you participate in these activities, do your best
to get publicity and written thanks for your efforts. These will come in handy
the next time you get into a fight over your priviledges. Don't be shy or think
that it's crass - just look how hard the Red Cross, Sal Army, etc work to get

publicity for their efforts - they even run advertisements on TV.
They know that without publicity they cannot continue doing their good work.
We should feel the same way.

I think that the Mexico City disaster showed the best of ham radio, and also
got us more favorable publicity than any event in recent memory. If we want
to be able to continue to help in the future like we did in Mexico, we
need to keep the public aware of our efforts in order to maintain our
priviledges.
         73,

If you are old enough (I admit it), you may find a similar feed method
which is the J antenna. It is described in ARRL handbooks from the late
30s to perhaps the early 50s - as a VHF antenna.

I've seen another way of feeding 160 meter verticals. BAck in the late
50s Ev Dillard, W3BKO, got an AM broadcast license for Wheaton, MD.
It just so happened that his FM station, WASH, had its transmitter in
Wheaton. He tried all kinds
Wheaton. Of course the FM tower was solidly grounded at the bottom, with
no leg insulators - it is a self-supporting tower. He tried all the normal
shunt-feed systems, connecting a little way up the tower, but the impedance
was awful. Finally someone pointed out that the tower was about a half-wave
on 1540 kHz and deeper though was necessary. The least-trouble solution

turned out to be to drive four posts in the ground, perhaps ten feed outside the tower base and run wires from them to a point a quarter-wave up the tower. they were then firmly attached to the tower up there. The bottoms of the wries were connected together and fed as a high impedance end fed half-wave. The wires formed a quarter-wave stub insulator with the tower. This system was used for perhaps 15 years. Dillard eventually sold WDON (AM), and it now uses another loction, sharing a tower with a station on 1050 kHz.

Sorry for rambling.....

Bob, W3OTC

To those who are interested in VLF:

There is a club devoted specifically to that subject. If you are planning
to get involved in low-frequency listening or experimentation, it would be
worthwhile to join, or at least send for a sample issue of their
newsletter. They might have some books or pamphlets available, also, or
reprints from back issues of their bulletin.

They are:
The Longwave Club of America
45 Wildflower Rd.
Levittown, PA 19057

The newsletter is called "The Lowdown", mailed First Class. Membership
costs $10.00 per year. I would think you can get a sample issue for $1.00.

(I don't belong to this club, but I have been aware of it for many years
[it isn't a fly-by-night newly-formed group]. This address is from a
reference to it in the October Popular Communications, so it should be
current and correct. It is also listed in the club directory in the WRTH.)

Regards, Will

Well folks, the seeds of a certain nameless discussion
reminded me of something I read in the ARRL operating
manual when I first got involved in ham radio. Beware
that this is not an exact quote.

They cautioned against discussions of both politics and
religion (sometimes inseparable) on the air, as these
topics frequently lead to unfriendly exchanges, which,
of course, have no place in our operating practices.

Enough said. 73, Ron WA2EYC

  One possibility for Adam Epsteins howling is a microphonic active
component. One way to find these is to tap various components with
a non conducting whacker untill you either try all the parts or
find one that makes noise in the speaker when you tap the component.
 Typically the noise in the speaker will be somewhat like the sound
of hitting the component.

Announcing the 4th annual Jersey Shore Ham/Computer Fest

Where: Neptune City Shopping Center (Rt. 35)

When: Nov. 3 (9am-3pm)

Admission: $3

Vendors: $6/table $3/tailgating

Talk-in: 147.045 +600 and 146.52 simplex

Spaces by advanced payment and SASE to:

Jersey Shore Ham Fest
P.O. Box 192
West Long Branch, NJ 07764
Phone: (201) 222-3009

Probably best to call if you want a table; time kinda short going the SASE route.

Since a discussion has been started regarding the quality of
ham rigs from Kenwood and Icom, I thought I would add my
findings on a brand new Kenwood TR8400 just out of the box.
The first symtom was during transmit in the 10 watt position.
Only about 5 of the 7 LED lights would come on and after a
short time the last two would flicker and die away. I think
this may have been due to a low voltage condition at the
radio, but from the discussions about loose ground connections
and circuit boards, I am not sure that this was the case.
The open circuit voltage at the radio was 11.9 volts and
the wires were about 14 gauge, so that will have to be more
closely looked at.
    The more important problem, however, is with the receiver.
I measured the receiver sensitivity as -87.9 dBm for 12 dB SINAD.
That's approximately 9 microvolts. No wonder I couldn't hear
anything !!!! I don't know what is causing the problem but
if it is anything interesting I will post my findings.

I'm a member of the ham radio dl because I'm a ham and because I enjoy
the ham radio related discussions whether they be about problems with
solid state rigs, antennas, or dx. I can only speak for myself but i am
getting extremely tired of these "Satellite viewing freedoms/Starwars"
messages which are being sent to the entire dl.

I'm not picking on you in particular, Joe, it's just that I've heard
enough. This stuff isn't remotely related to ham radio and it just
doesn't belong here. Can't you all call it quits or move to another dl
with it?

This is a dear john letter... Re: "Kantronix in Mexico..."

Dear John:

I have a Kantronics Packet Controler and mine works just fine... and
right out of the box! It's performance has been simply flawless.

Please note the manual supplied is a USERS manual, NOT a
TECHNICAL/SERVICE manual. The manual is complete with full detailed
descriptions of commands and control. It's internal memory can be
pre-set so the controler powers-up in the opreators favorite modes or
ready-state.

I DID have to remove the front cover once (two screws, phillips) to reset a pin jumper to agree with my C-64 format... it was set for RS232 from the factory. With all of the software/firmware theft/copy efforts; I can hardly fault Kantronics for not providing more specifics on internal operations. If a technical manual is offered from Kantronics, the data you seek may be there.

The fact that you wasted several hours during a critical emergency net time only shows how important it is to be prepaired! Participate in RACES {or some other emergency net/effort} and assure yourself that the equipment you intend to depend on is in top shape and tested.

The syndrome was "...we couldn't get it to receive anything."; perhaps the problem was a shorted audio mini-jack? Dead/inop AC outlet/power supply? Not enough receive level/audio? Incomplete/inop software? I try the EXTERNAL fixes BEFORE I drag out the scope, schematics and soldering iron! In other words, If it ain't broken, don't fix it! Besides, I beleive I have a one year warranty on mine.

Other dear readers:

I think the Kantronics is one of the finest new adventures in the amature spectrum! A special sale price of $219 makes it well within the budgets of most hams. A low cost/used VIC-20 (Commodore) (aprox.$50), a TV and tranceiver! Even if you are NOT a 'computer-type' or can type just 10 WPM! A line or two (of type) is typed first , you see it before you send it, then the send command... It almost appears that you can type 60WPM! It's been super to see Las Vegas to LA/San Diego/SF/Arizona traffic and hamming every day! Very soon the 'network' will be international!

Respectfully,
Tony Cardenas

Speak up, my surveillance device can't hear you clearly
The Friday, October 25, 1985 Communications Daily reports that the
US Office of Technology Assessment has issued a report holding that
cellular and cordless telephone calls and other forms of new
communication devices are not sufficiently protected under the 1968
wiretap law. Congress has a measure under consideration that would
strengthen such privacy law requirements extending protection to
cellular and cordless telephones. Markup is expected, for both the
House and Senate versions of the bill, by early next year. There is a
possibility of enactment by the end of 1986.

With regard to wiretapping, USA Today says that 35 federal agencies
use, or have plans to use, new electronic surveillance equipment
that is not controlled by the 1968 law. The article further reports
that domestic US agencies have 288 million files on 114 million people
and that computerized recording devices could improperly monitor
innocent citizens.

> poor design/engineering and won't take it any more!

    Aw, come on... Didn't anyone ever wonder why ham-quality gear cost an order of magnitude less than commercial-quality gear? And TWO orders of magnitude less than military-quality?

    You get what you pay for. Period. I have looked at so-called commercial versions of hand-held radios made by ICOM, Wilson, etc., and that stuff is real trash compared to GE, Motorola, Repco, etc. - of course, it costs a lot less, too.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

I am interested in finding out more about satellite tv, especially about the
construction of home earth stations. I am a complete newcomer to this field,
 and
would appreciate any help comments, sources, whatever.

Thanks to all in advance.

> Congress has a measure under consideration that would
> strengthen such privacy law requirements extending protection to
> cellular and cordless telephones.

I see this as a very unfortunate development. Once again, the lawyer types think they can simply wish away a problem with an unenforceable law. Has anybody told them that cordless telephones can be intercepted with any cheap AM radio? Or that under the proper circumstances cellular phone conversations can be overheard with an ordinary UHF TV set?

Naturally, one major effect of such a law would be to hassle us hams. No doubt there'd be an effort to ban the sale of general coverage receivers (either of the traditional HF type or the new VHF/UHF types like the Yaesu FRG-9600 or the Icom R-7000). Bad guys still intent on monitoring cellular phone would still be able to build their own receive converters with little trouble, and unless we repeal the 4th amendment and allow arbitrary police-state searches of private residences for listening gear, the law won't stop them. Worse, the mere existence of the law will give the users of cordless and cellular phones a false sense of privacy, and nothing is more dangerous when dealing with communications security.

The cellular radio operators should be required to inform their customers that their conversations can be overheard (as cordless phone users already are). Customers should be made to understand that they are responsible for their own communications security and encouraged to obtain voice scrambling devices should they wish greater privacy. I see no practical alternative.

Phil

Phil, I agree with you. I appears that we have two ways of screening ham radio for "quality" of operators: (1) By a tough technical exam; (2) By a tough code axam.

Citizens Band had neither-- therefore, a complete lack of "quality" screening.

It seems to me that the chief challenge for the hobby now is how we can best attract the most of the best young innovators. I just don't see a code requirement of over, say, 5 or 10 wpm as contributing to this end.

Summary: Society is vulnerable

In article <701@ihu1h.UUCP> parnass@ihu1h.UUCP (Bob Parnass, AJ9S) writes:

> CHICAGO - A pirate broadcaster has been treating Chi-
> cago area radio listeners to some unscheduled program-
> ming by transmitting on the microwave studio-to-
> transmitter links of area AM radio stations.

It is surprising that this sort of thing hasn't happened sooner. There are so many links out there, most of which use very low power (a watt or two) that it is a testament to the basic civility and sense of order in our society that this electronic vandalism hasn't happened more often.

In any case my heart goes out to the chief engineers at the stations involved. A surprising number of both AM and FM stations have unattended transmitters controlled from the studio via the STL link. There are shutoff circuits to shut the transmitter down if the link is lost but essentially no protection whatsoever against someone simulating the signal. And I suspect in at least some cases, there is only limited backup capability to shutdown the transmitter by phone lines so a spoofer might have several minutes of air-time before the transmitter could be manually shut down.

Years ago I used to wonder why radicals (yes, I'm from that generation but not of that political persuasion) didn't try to take over the microwave TV relay backbone routes used until recently to distribute network programming to local affiliates to run 15 or 30 second anti-establishment commercials during some major TV event. Parking near a hilltop At&T site with a VCR, a 4 Ghz TWT power amplifier (available as surplus) and small dish would be as effective a means of getting media attention as blowing up a building. And as far as I know some care in simulating the real longlines video format would probably suffice to ensure that automatic protection channel switchovers didn't take one off the air.

Today taking over a TV network feed would require generating enough RF EIRP to be a couple of db's above the network's uplink transmitter at the satellite. This would involve hundreds of watts and a moderately large dish. It would, however, require the resources of the defense department to find such a bogus uplink with no more indication of it's location then that it was somewhere in or near the continental US or Canada or Mexico. I doubt if the required special resources are set up to handle a random and unexpected 15 second uplink during say the Superbowl. And of course, if one happens to live near the ground sites (mostly Long Island, and LA) that uplink the network feeds, it might be possible to take over a local microwave link feeding the uplink.

And of course if the ambitions of the group involved were less than national even a toy source of 3.7-4.2 or 12 ghz (NBC) rf would do quite nicely if located near the satellite dish that served a local TV station as satcom signals are so very weak. I suspect the local oscillator out of a TVRO would do the trick.

But more sinister than the few seconds of direct media access such a caper might gain, is the implications for other more critical things that are controlled by RF links. For example, in the area where I live the power companies use microwave links to monitor and control their distribution network. I suspect a clever and somewhat more sophisticated spoofer

could issue commands to remote switching stations that would cause a great deal of havoc. Doing so would require some cleverness since the RF links are mostly multichannel fm-fdm-ssb, but since the equipment is quite possibly only equiped with loss of carrier and pilot alarms, it might be possible to spoof with simple enough systems to be within the reaches of a terrorist organization.

In any case all of this ought to make those of us who design systems think in terms of how we might make them less vulnerable. One method that works remarkably well in controlling vulnerability to spoofing is to transmit the information digitially and encipher the resultant bit stream. A spoofer would have to know the code to transmit anything meaningful. It is not even necessary to encode the information just as long as there is some form of data integrity checking that involves a secret key that the spoofer cannot obtain by monitoring the channel.

A method that would work for radio and TV links is transmission of a validation bit stream on a subcarrier. I suspect this could be accomplished with a $50-100 dollar microprocessor and VCO. I doubt that anyone could argue that something that cheap wasn't worth considering ...

Subject: Kenwood TR-2400 Blown UP!

When I got my TR-2400 (used) I received a few "Weak Modulation"

signal reports and so I proceded to turn up the mike gain pot
that was clearly marked on the schematic and was easily found
on the circuit board. I figured that such a slight change could
not possibly get me in to trouble. I was wrong. Upon putting
the radio back together I asked for a signal report to see if
my modulation was up. It was.

I thought I had it licked until a few days later I tried to access
the local autopatch. It completely ignored me. Hmmm, I thought,
let me turn this little pot over here that increases the voltage
from the touch-tone chip. That didn't work. I had better look at
this on the scope, I thought. I probed around with the comparatively
large scope probe and blew out a coil.

The coil is made of a fine wire wound on a resistor. Its purpose is
to act like a fuse. The only problem is that the resistor still conducts.
Not aware of this at this time, I pluged it in to a 10 amp 12vdc supply.
The radio worked. Unplugged it, and it didn't. Figured the battery was
shot.

I tested the battery and found that it was good and figured that
there may be something wrong with something between it and the
circuit. So as an experiment I wired the battery in through the
external voltage connector to see if it would work. It didn't,
it blew up instead. I had connected it backwards. Several of the
transistors literally exploded, and some didn't. I still haven't
figured out where all the non-exploded bad transistors are.

Has anybody faced such a problem with this rig, or is it just me.
If anyone has any contructive comments I would appreciate them.

Dennis Hawkins / N4MWD

Just recently (Thanksgiving weekend) I saw an AP wire story reporting that one of the satellite uplink operators had filed a formal complaint with the FCC alleging that deliberate interference (several hours of unmodulated carrier) had occurred to one of their signals. They went on to suggest that the interference might have been an attempt to retaliate against the use of video encryption devices. However, the FCC seemed unconvinced that the possibility of accidental interference caused by a sloppy operator at another legitimate uplink site had really been ruled out.

I guess the day you see HBO's signal pre-empted by a crude B&W slide that says (in true ransom-note fashion):

ThiS StAYs oN uNTil tHe SCRamBleR GoES oFF!

you will know for sure that deliberate jamming has begun. The only practical way to find such a jammer (who could be anywhere in the CONUS, Cuba, northern Mexico or southern Canada) would be with a low earth orbiting ELINT (electronic intelligence) satellite, and if the DoD has such a beast they are unlikely to "compromise intelligence sources and methods" by using it to solve a mere civilian problem (except perhaps by phoning an anonymous tip into the FCC...)

I looking for feedback from anyone who has had direct experience with
either ICOM or Kenwood HF transceivers in a mobile environment. I'm
currently using an ICOM IC-720A for dedicated mobile use which has been
in my vehicle for the past three years. Although the front end of the
720A is very good, the noise blanker, under crowded band conditions as
for example on 20m, or 40m, or in the presence of moderately strong
carriers, is virtually ineffective.

The problem is one of a basic design flaw in the noise blanker and its
associated circuitry. If there is anyone who has first-hand experience
with an HF transceiver in a mobile environment which has a EFFECTIVE
noise blanker under both crowded band conditions and in the presence of
strong carriers, please contact me.

I like your comment of reading QST "even though it was not designed
for just me", as you put it. That's something to remember,...., the
ARRL has to care for a lot of people; so the magazine will have a
little bit of everything in it, and hopefully something good for

everyone.

First of all, the person who suggested that digital subcarriers
might prevent persons from "taking over" STL's and uplinks is correct--
they could stop people from actually transmitting their material through
the main broadcast facilities. However, such systems would not
prevent jammers from simply disrupting communications by interfering
with or capturing out the feed channels, even if they couldn't get
their material "on the air" in a "big" way.

Locating illicit uplinks would indeed be tricky. I suspect that if
the broadcasters went to DoD and pointed out that what happened to
them could happen to portions of telephone service, etc., DoD might
be forced by public opinion to help in the search. Another possibility
is that the broadcasters might get together and launch their OWN
low orbit "tracker" satellite just to deal with such situations
when they pop up.

My guess is that the current problems aren't intentional jamming, but
are rather inept ground crews: "Oh, gee, you said one three FIVE degrees;
sorry about that!" But this doesn't mean that the real jamming won't
come along eventually.

qst de k9eui
hr propagation forecast bulletin 49 from arrl headquarters
newington ct december 9, 1985
to all radio amateurs bt

between november 27 and december 8, the solar flux curve followed that for the same days of the previous solar rotation almost exactly. it held at 70 or 71 until december 4, then rose gradually to 75 on the 8th. if this tracking continues as expected, the flux will peak about december 13, then slide back to near quiet sun levels by the 24th. when solar activity is low and day to day chamges are small, geomagnetic activity is usually low and propagation is mostly good, but with low muf. we are likely to see a lot of this sort of thing for at least another year. even 14 mhz goes quiet early in the evening, but both 14 and 21 mhz can work well in the winter months. openings on 24 and 28 mhz are brief and widely scattered, unless the flux moves into the high 70s or higher. there is likely to be some improvement in the length and geographical distribution of dx on all 4 bands this week, but the shortening hours of daylight in the northern hemisphere work against major improvement.

somewhat higher geomagnetic activity is expected this week. it will be most harmful in our more northerly states and in canada. transequatorial circuits may even work better at such times, especially on 21, 24 and 28 mhz. even 50 mhz should not be ruled out.

one plus factor for the higher frequencies is the annual geminids meteor shower, peaking this week. this is no ragchewing mode, but it can pay off with fast vox or break in cw.

the propagation charts published monthly in qst provide the

best information on the most likely times for conventional dx work on the amateur bands. the actual muf for a given time, on a given day, may vary markedly, depending on the solar flux and the level of geomagnetic activity. the peak times are accurate, because they depend on the position of the sun with respect to the path in question.

there was an error in the address recently given for the conductor of this column. the correct address is,

edward p. tilton, w1hdq
p.o. box 5529
spring hill, fl 33526

american sunspot numbers for november 21 through 27 were between 0 and 11 with a mean of 2.7. there were no sunspots visible for the week november 28 to december 4 ar

Dec 11 liftoff? or the 18th.
Qst had the 11th i believe and net.columbia had the 18th?
But as you know all can change.

As Requested:
~~~~~~~~~~~~~
Frequencies for shuttle are:

7185 KHZ 40Meter Band - Lower Side Band
3860 KHZ 80Meter Band - Lower Side Band
14.295 MHZ 20Meter Band - Upper Side Band
147.45 MHZ 2Meter Band -FM (wash. dc area)
147.00 MHZ 2Meter Band -FM (new york,new jersey,conn.)
(rumor has it it can be found on 20.1983 also)
~~~~~~~~~~~~~

```
 ============================================================
 435.003 mhz and 145.972 are in my notes as "direct"
 frequencies for the flight, unfortunately i didnt
 write much else. hi hi
     Mission 24/61-C   12/18/85 (launch date)

I can believe that WRNO's final amplifier(s) cost $10,000 or more. They are probably water cooled Eimacs which aren't really made new, but instead are remanufactured. This is the case with most broadcasting tubes in the nonexpendable class.

I'm a broadcast engineer in my spare time, and have found that spares are not unreasonable:

4CX250F	$67.75
4-400C (Amperex)	$59.00
833A	$65.00
845	$85.00
4CX5000	$375 rebuilt, $875 new from Varian/Eimac

The problem that many hams face is not the cost of "real" RF tubes, but the cost of some "typical" ham tubes used at HF. Four 6JS6C/6KD6 horizontal sweep tubes can eat the best part of a $100 bill. Not everyone has the plate transformers lying around to operate a 4-400C or 4CX250, nor the air system sockets and chimneys required. As for the cost of the other ceramic-metal tubes cited, try CeCo or another broadcasting tube vendor.

Stay away, though, from the CeCo house brand tubes (although the 833's I have in my BTA-1E modulator are still working) as they are usually made in countries still using a lot of 'em. I've heard horror stories about the Chinese inability to perform a proper pin or terminal-to-glass seal. The 807's (made in the USSR) I had almost took out my high voltage supply in the RCA transmitter (because the modulator grids are direct coupled and the tube was badly shorted out of the box).

In two Collins 831F2 FM transmitters, the remanufactured tubes have lasted longer, according to the chief engineer of WPEG Concord, NC... much longer. However, there probably aren't a lot of hams using a 4CX5000 (or

whatever, I think the type number is wrong - you know, ceramic-metal, bigger than a football).

Spares aren't that hard to come by, but when you purchase them from the local place which carries Sams' Photofacts and that ilk, you are going to get royally reamed. Your best bet is a broadcast supply house for "real" RF tubes (not sweep tubes, however). I don't know where one would get 6JS6C's anymore without parting with $25.

Folks, I've a real problem ...

I, for better or worse, inherited a Cetec-Sparta SS1000 MW transmitter to be retuned from 1590 to 1210 kHz. This is an early all-solid-state bipolar AM transmitter.

Well, I set the impedance at the input of the output filter to 130 ohms, plugged in the crystal for 1210, turned it on, and promptly blew 48 output transistors in the final amplifier. Yes, I had a 50 + j0 ohm dummy load connected to the transmitter output.

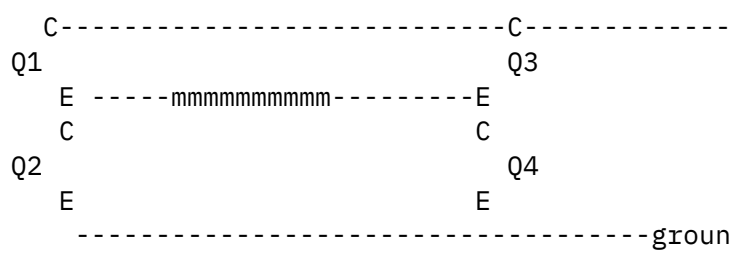
The output transistors were made by TRW, type PT 9122. According to the TRW RF Products division, this isn't even an "rf" transistor but a "power" device sold by the Opto division. They were trying to get the data on this power transistor, when I finally got fed up with this approach, I

called Elcom-Bauer (who supposedly bought Cetec-Sparta). They suggested that TRW said that type SVT-350-5 would work.

A quick check of my Motorola book crosses this device over to another with a storage time of 3 microseconds. Isn't this a wee bit long?

My question is:

The output stage consists of four identical bridged PA sections which are transformer coupled through a wideband ferrite device. Each PA section consists of two quasi-complementary NPN transistor stages, which is switched in opposite phase by a driver transformer (square wave drive)... see below



mmmmm represents the transformer winding which couples that particular PA section to the output transformer. The drive is arranged such that the transistor Q1 and Q4 conduct, then Q3 and Q2 on the opposite phase. There are various diodes in these leads to prevent undershoot, and to "remove the effects of storage time."

What this transmitter really seems to amount to is a giant switching power supply.

If you were selecting output stages for this, wouldn't one want to get output transistors which had the fastest possible switching time? What are my chances for converting this device to HEXFET's (tm)?

If you have the data for the PT9122, SV3-350-5, or any help at all, let me know. I've got to get this thing on the air before the end of the year (or face a quick rebuild of a 25 year old 10 kw Collins transmitter).

I've been a life member of ARRL for about 10 years or so (so, my QST is
now "free" sort of). I subscribed to QEX a little after it got going,
thinking I'd get more of a Ham Radio technically oriented publication.
I was very dissappointed, and let my subscription drop upon expiration.
QEX was more like "amateur elementary electronics". The death of Mr. Fisk
(W1HR) at HR was sadly the end of good, consistant technical amateur radio
publication. Alas.

                          -de WB4IOJ (very ex- KH6FON)

P.S. - In a couple weeks it will be the 20th birthday of my WH6FON
       novice licence. I knew you'd be thrilled to hear it. :-)

qst de k9eui
hr propagation forecast bulletin nr 50 from arrl headquarters
newington ct december 16, 1985
to all radio amateurs bt

through the middle of the month, the solar flux curve for december follows that that for four weeks earlier quite markedly. combined with the beginning of the short winter season for sporadic e skip on the higher frequencies, this made for an exciting arrl 10 meter contest on december 14 and 15. there was more visible activity on the sun in the past few days than we have seen in quite some time. the solar flux peak of 83 on the 15th could hardly have been better timed. the flux curve is expected to move lower this week, but we should not see really quiet sun conditions again before about december 24.

recurrent geomagnetic disturbances are expected about december 17 and 27. generally good propagation is likely otherwise, with gradually lower muf, through the years end. there should be another slow rise in sola in solar activity during the first week of january.

for a long time prior to late october, solar activity was averaging lower than would have been expected, with at least two years remaining in solar cycle 21. what we hae experienced in these eight weeks or so is probably a fair example of what lies ahead for at least the rest of the northern hemisphere winter.

the author of these bulletins is interested in the usefulness of the international ten meter beacons during the years of lowest solar activity. if you look for beacon stations frequently, we would appreciate receiving a list of beacons heard during 1985. please send your list to,

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds) per year for First-Class Mailing to the U.S., Canada, and

Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

In this issue:

o U.S. Korea Third Party Holiday Traffic OK

o Will Canada Restructure Its Amateur Radio?

o Spread-Spectrum Communications In Amateur Radio

o ...and much more!

WILL CANADA RESTRUCTURE ITS AMATEUR RADIO?

Canada's Department of Communications recently released a paper outlining proposed amendments to the regulations, policies and procedures concerning radio amateurs. If implemented, the new policies would update the requirements for becoming a radio amateur given today's technology and operating environment.

DOC's paper addresses amateur examination and certification from its inception in 1914 to the present, the regulation of the amateur service, and cur-rent issues affecting amateur operation in today's environment. Touched upon are amateur certification without knowledge of Morse code, incorporation of digital/computer technology in amateur equipment and their effects upon amateur practices and procedures, the trend toward experimenting with different modulation techniques and the trend away from home- built equipment.

DOC proposes a new practice of certifying individuals as Amateur Radio operators. The examination for a basic certificate will shift from the current emphasis on technical knowledge to the practical knowledge required to operate a modern amateur station. A knowledge of the regulations governing the amateur service would still be required. The new basic certificate would allow the individual to operate a 250-watt station on frequencies above 30 MHz. Anyone wishing to use frequencies below 30 MHz would require another certificate, obtained by passing a Morse code test at 12 words per minute. A third certificate, which would allow the individual to operate with a "home built" transmitter and with a maximum power of 1000 watts, is also proposed.

The Department of Commerce is asking for comments from the general public, especially those who are not yet amateurs but would like to become one. A copy of the DOC paper, "Discussion Paper on a Possible Restructuring of the Amateur Radio Service in Canada," is available from any regional or district office of the Department or by writing to: Director General -- Radio Regulatory Branch, Department of Communications, Journal Tower North, 300 Slater St, Ottawa ON Canada K1A 0/C8.

Detailed DOC Proposals for a Restructured Amateur Radio Service in Canada (extract)

The examination to certify a candidate for the operation of a basic, modern amateur station (Certificate "A") would consist of:

1) installation and operation of modern amateur stations; including proper interpretation of meter readings such as Automatic Limiter Circuit [sic] (ALC) and Standing Wave Ratio (SWR) and the adjustments necessary to prevent interference; proper grounding techniques; and correct installation practices from transceiver to antenna, including auxiliary devices such as low-pass filters and antenna tuners;

2) basic electronic theory, safety practices when working with simple circuits; tracing and correcting interference problems such as audio rectification and receiver front-end overload;

3) antenna and propagation theory, including types of antennas, feedlines and characteristics of propagation phenomena; and

4) international and domestic regulations applicable to the amateur service.

It is estimated that approximately 40 hours of instruction would be required to obtain the basic knowledge necessary to pass this examination. Successful candidates would be issued Amateur Certificate "A" and would have the following privileges and restrictions:

1) the transmitter portion of the station, from the microphone or keying input of the transmitter to the final output, would have to be commercially built and marketed specifically for use on the amateur frequencies. All other components of the station, such as the receiver, filters, antennas, computer interfaces, etc., could be home-built;

2) no emissions would be permitted below 30 MHz, but all would be permitted above 30 MHz;

3) stations would be limited to a maximum power input of 250 watts d.c.; and

4) licensees would be limited to operating stations under their physical control, but not repeaters or remote base stations.

The examination to certify a candidate for operation in the spectrum below 30 MHz (Certificate "B") would consist of a Morse code examination at a speed of 12 words per minute.

Successful candidates would receive Amateur Certificate "B" and, providing they held Certificate "A", would operate under the same conditions as those granted by that certificate, except that

they would be allowed all types of emission on any amateur band.

The examination to certify a candidate to construct and operate any station or to be the licensee of a repeater or other non-standard station (Certificate "C") would consist of:

1) advanced electronic theory, to augment that required for Amateur Certificate "A", with a degree of difficulty somewhere between the present Amateur and Advanced Certificates.

This would accommodate the many amateurs who are more technically oriented and wish to construct their own stations. Successful candidates would be given Amateur Certificate "C" and, provided they held Certificate(s) "B", or "A" and "B", would be permitted to:

1) construct their entire stations;

2) sponsor and operate repeaters and remote base stations; and

3) operate their stations with a maximum of 1000 watts d.c. input

Implementation

Candidates writing examinations under this structure would be allowed to write any or all of them at one sitting. However, the minimum qualification for a station license would be Amateur Certificate "A".

Existing amateurs holding either an Amateur Radio Operator's Certificate or Amateur Radio Operator's Advanced Certificate would be deemed by regulation to have all the privileges of the three proposed certificates, and those holding the Amateur Digital Operator's Certificate would be deemed to have all the privileges for Amateur Certificates "A" and "C".

SPREAD-SPECTRUM COMMUNICATIONS IN AMATEUR RADIO

When we go on the air with conventional AM and FM emissions, the energy in each resultant signal is concentrated narrowly around a center frequency. Signal bandwidth increases with information rate. The hassle with such compact signals is that they're quite vulnerable to other similar signals at or near the same center frequency. (We bet you've already experienced somebody else calling CQ, or a "test pest," right atop the station you're working, for example.)

Spread-spectrum signals don't follow this rule of concentrating signal energy around a center frequency. Their bandwidth is not necessarily tied to data rate. The whole idea of spread-spectrum work is the intentional spreading of signal energy over such a wide bandwidth -- both in frequency and over time -- that the signal's energy isn't very great in any one place for very long. What's the point? Great immunity to non-

spread signals -- like CW, SSB, RTTY -- for one thing, and little likelihood of "collision" with other spread-spectrum signals spread according to differing binary sequences. And these techniques really work: spectrum-spreading is a popular anti-jamming technique used by the military, for instance, because it's hard for anyone to interfere with a spread-spectrum signal who doesn't have its binary-sequence "key."

Radio amateurs are going to have their shot at spread-spectrum work as of June 1, 1986. That's when the rule amendments specified in FCC's Report and Order in GEN Docket 81-414, "Amendment of Parts 2 and 97 of the Commission's Rules and Regulations to authorize spread-spectrum techniques in the Amateur Radio Service," go into effect.

FCC had some ticklish questions to address in allowing us spread-spectrum operating privileges. For instance, since one of the main uses of spread-spectrum techniques has so far been the hiding of signals (implicit in the anti-jamming use of spread-spectrum techniques by the military), we couldn't just bring up our spread-spectrum rigs under present rules without transgressing prohibitions against use of codes and ciphers. FCC has specified the methods to be used in amateur spread-spectrum work closely enough so that the Commission is assured of being able to perform its monitoring and enforcement duties even when an amateur spread-spectrum station might be inaudible to those of us listening with "conventional" receivers. We will have to reaquaint ourselves with our old friend the logbook; FCC wants complete documentation of how and what we'll be doing.

There was also the concern that since authorized spread-spectrum signals might appear as broadband noise, spread-spectrum work should be limited to amateur bands offering plenty of "wide-open spaces," to keep intra-service interference possibilities to a minimum -- especially while we're getting our feet wet with the new techniques. FCC concurred, and limited spread-spectrum work to bands 420 MHz and above.

We'll still have to identify our spread-spectrum transmissions with narrowband emissions, as FCC puts it, "so that CW, SSB and/or narrow-band FM receivers, which might be victims of interference, can receive the station identification." Frequencies used for such IDs will have been chosen to minimize interference to, while facilitating identification by, other operators.

Right off, spread-spectrum work will be limited to domestic communication (not international work), as other national administrations will have had to satisfy themselves of the achievement of proper safeguards against encryption and intra-service interference before their amateurs jump into the spread-spectrum swim.

This is really new ground for Amateur Radio -- so new, in fact, that we have a number of decisions to make about exactly how to go about spread-spectrum work in ways guaranteeing station-to-station compatibility (see "Interoperability," below). FCC has not limited our choice of spread-spectrum options so narrowly that we can just press the button and go, although the

final rules limit spreading methods to frequency hopping and direct sequence only. This does offer the opportunity for a modern jibe, though: when spread-spectrum really takes off, the bands will be jumping!

Part 97 updates relating to amateur use of spread-spectrum techniques will appear in a subsequent Letter.

AD HOC COMMITTEE ON SPREAD-SPECTRUM INTEROPERABILITY

At Minute 50 of its July meeting in Hartford, the ARRL Board of Directors authorized an Ad Hoc committee to write the necessary interoperability standards for spread-spectrum operation in the Amateur Radio Service. In granting amateurs spread-spectrum privileges (see previous item), FCC specified only what it thought necessary to guarantee its ability to monitor such transmissions, and to avoid encryption. Standards to be considered by the committee include: frequencies of opera tion, chip rate, the code, code rate, spreading function, transmission protocol(s) including the method of achieving synchronization, modulation type, type of information transmitted, and method/frequency(ies) for identification.

The seven members of the committee, chosen by ARRL President Larry Price, W4RA, are: David W. Borden, K8MMO, Chairman; Hal Feinstein, WB3KDU; William J. Howard, K1LNJ; John R. (Dick) Bingham, W7KWR; William E. Sabin, W0/IYH; Frank Butler, W4RH, Board Liaison Member; and Charles Hutchinson, K8CH, Staff Liaison Member.

FCC CLOSES LOOPHOLE IN THIRD-PARTY PARTICIPATION

On November 20, the Commission released a Report and Order PR Docket 85-51, amending the amateur rules to prohibit amateurs who have had their operator licenses suspended and station licenses revoked from participating in Amateur Radio communications as third parties. The Commission said that without such an amendment, a former licensee could continue to engage in the types of communications that had necessitated enforcement in the first place if permitted by operate as a third party by a current licensee. It is important to note that the amendment does not change present rules provisions pertaining to third-party participation. It simply precludes disqualified persons from attempting to circumvent enforcement sanctions by participating in third-party communications.

To update your copy of the FCC Rule Book, amend Section 97.79 of the Rules for Amateur Radio Service by deleting paragraph (d). Section 97.114 ("Third-party traffic") is revised to read as follows:

a) Subject to the limitations specified in paragraphs (b) and (c) of this section, an amateur radio station may transmit third-party traffic.

b) The transmission or delivery of the following third-party

traffic is prohibited:

(1) International third-party traffic except with countries which have assented thereto;

(2) Third-party traffic involving material compensation, either tangible or intangible, direct or indirect, to a third party, a station licensee, a control operator or any other person;

(3) Except for emergency communications as defined in this part, third-party traffic consisting of business communications on behalf of any party.

(c) The licensee of an amateur radio station may not permit any person to participate in traffic from that station as a third party if:

(1) The control operator is not present at the control point and is not continuously monitoring and supervising the third-party participation to ensure compliance with the rules;

(2) The third party is a prior amateur radio licensee who license was revoked; suspended for less than the balance of the license term and the suspension is still in effect; suspended for the balance of the license term and
relicensing has not taken place; surrendered for cancellation following notice of revocation, suspension or monetary forfeiture proceedings; or who is the subject of a cease and desist order which relates to amateur operation and which is still in effect.

PROPER CREDITS FOR THE CHALLENGER VIDEO

If you heard W0ORE's signals transmitted from the Space Shuttle Challenger last August, you'll want to see the videotape on SAREX, the Shuttle Amateur Radio Experiment. Executive Producer/Writer, Roy Neal, K6DUE; Producer/Editor, Frosty Oden, N6ENV; Field Producer/Technical Supervisor, Bill Pasternak, WA6ITF; Production Assistant, Paul Courson, WA3VJB. The 18-1/2-minute SAREX videotape documents all the excitement of this history-making Ham-in-Space mission, including the slow-scan pictures Tony England transmitted to Earth during the mission. It's available from the ARRL Publication Sales Department; postpaid prices are $25 for VHS format and $35 for U-matic, and it's available on loan to anyone who can have it shown to an audience of prospective hams -- ask for VT-36 from the ARRL Film Library.

US/KOREA THIRD-PARTY HOLIDAY TRAFFIC OKAY

The usual US/Republic of Korea agreement to allow phone patches from HL stations to the US will be in effect from 0001Z 20 December 1985 until 2359Z 4 January 1986.

CLUBS SOUGHT TO SPONSOR DX TEST PLAQUES

Your club should consider sponsoring a plaque for the 1986 ARRL International DX Contest -- sponsorships in several

categories are still available. Here's an excellent chance to publicize your club's commitment to DX and contesting in the pages of QST. Contact the ARRL HQ Contest Branch for details.

Can someone please tell me how often the ARRL newsletters are placed in this notesfile. Also is there another notesfile somewhere that deals with packet radio or gunnplexers?

I am also dissappointed in QEX and the few articles that are published could easily fit in QST and make it a better magazine. The real problem is probably that very few people submit articles to QEX and no-one is to blame but those of us that have some good technical background and don't take time to share it with others (myself included). Maybe the ARRL needs to assign volunteers to look into different areas of design and theory and publish more articles in the QEX??? Don't know the cure but I am ready to let my subscription drop but first I have to evaluate why I haven't submitted anything.

I believe that the answer to the question is simply the other
side of the success of the solid state device industry. Tubes
which at the end of the second world war were at their zenith are not relatively
rare and not commonly made in the U.S. Most
of the tubes we get now are from Taiwan and such. Special
purpose tubes such as UHF transmitting tubes are made virtually
by hand on small labor intensive assembly lines. Their cost
reflects their nature: small volume, high cost of materials
hand manufacture. Although the insides are not platinum, there
are many costly materials, precision must be high, and the
product subjected to temperature, voltage, current, etc. extremes which we are not
used to in our solid state world.
If you take to trouble to look up W2SUE an OT who was a
vacuum tube engineer during the war (and developed the
all metal vacuum tube) he can tell you the details.
All in all, having become a ham at the end of the golden
age of tubes and having experienced three and 1/2
generations of logic I count myself lucky to have been around
for the experience. I cannot believe that tubes will continue
much longer for even the highest power amateur
applications (I remember when a 2n35 put out a few mw and cost
$35 "real" dollars!) Even the $10,000 Eimac monsters may
one day become HPCMOS or some such! Another way to put it:
All rare antiques are expensive! - Bob K2SK >>

My son is doing a science project on hf propogation. He is
currently using WWV and CHU as reference signals. Does anyone
have a list of any other beacons that could be used?
We would prefer something in geographic locations other than
Colorado and Eastern Canada. Are there any signals that could
be used in the Pacific and in Eurasia?

He is trying to show that the sun affects radio propogation.

I also was in broadcasting and most of my experience with tubes involved
Eimac 4-400 types. In 5 different transmitters, I naver had to replace
one due to failure of any kind. One time, within a 2 year period, I did
swap some around to better balance the currents in the plate modulator
pair. At one FM station I was at, The idiot owner had shorted out the
air sensor switch and had installed toggle switches to turn on the
blower and exhaust fan. One morning (after a very late night out) I
forgot to turn on the air switches when I fired up the transmitter
and it ran for 6 hours without air coolong at all. These 4-400A's were
operating at 3825 volts at 325ma and the plate color was close to white,
but even after the no-air episode, those tubes were still functioning
properly 18 months later when I quit the job. On the other hand, the
driver stage consisted of a push-pull pair of 6146B's and even though

they were loafing along, I had to replace them every 3 weeks!
(The B's lasted a week longer than the A's).

With the good experience I had over the years with Eimac tubes, I would
not use anything else in my higher power ham gear. They should last a
lifetime in amateur service on HF.

The only "bad" experience I had with tubes in broadcast equipment was
with the 5879 pentodes used in the preamps in a Gates "Dualux" console.
These tubes were so noisy that I had to hand-pick them to get the board
to pass the proof-of-performance test. RCA boards I worked with used
12AY7 dual triodes and always were quiet and reliable.

(An interesting thing happened when doing a proof test on the previously
mentioned FM station when the hum level was too high. We had to end up
cutting the lacing cord on a wiring harness in the Gates "Level Devil".
This unit is a compressor/expander. The idiot designers had put the
115 volt AC wiring in the same harness as the unbalanced input level
control wires behind the front panel!)

I always advise ham friends that replace tubes in their equipment to
test all tubes in a good (Hickock) transconductance tester first.
One time when I bought a pair of RCA 6146's and a 12BY7 for my Kenwood
820, One 6146 was shorted and the 12BY7 was gassy. Never trust a new
tube these days (the big transmitting ones are an exception).

Summary:

It seems I found an ideal location for placing in a 5000 foot Beverage

receiveing antenna, the only problem being that it is a quarter mile
away from my dorm, and that I cannot string coax across or above the street
directly adjacent. Even if I could, there are a number of adjoining
properities whose owners refuse to even hear about even any connections
whatsover, even IR beams, crossing thier property line.

I have an Advanced Class license, and I am primarily interested in working
80 and 20 meters on relatively low power, hence the tremendous possiblities
raised by such an extreme length antenna. The problem is that I need some
means of relaying by radio the control signals to tune a local receiver
hooked up to the antenna, but that I do not want to violate either repeater
regulations or cross-service regulations. For instance, suppose I use the
AM band at less that 100 milliwatts power, 10 foot antenna length, which
are the FCC's maximums for unlicensed operation; to relay control signals to
and resulting audio from the antenna site. Would I be violating cross-service
regulations due to the retransmission of amateur traffic on AM, even though
the power and antenna restrictions for citizen use are conserved?

If other bands in amateur service or common carrier are acceptable, or if
the strategy I outlined is acceptable, in that no rules (especially part 97!)
are violated or even bent, I would like to know. Please advise.

Regarding K9UN's request for HF beacon station listings, I suggest
the World Radio Handbook (Billboard Publications - from Holland) which
lists hundreds of HF broadcast stations and frequencies, etc. While not
exactly beacons, and using directional antennas, HF BC stations still provide
a way to infer MUF, etc. Note that the BBC, Radio Moscow simulcast on a number\
of frequencies for the same target area - compare the signal strengths....

The folowing is the text of a letter sent to the FCC. It has been assigned an RM number, I just don't have it now. I'm posting this to see what kinds of comments are generated, personally, I'm slightly favorable to the proposition, but time and arguements will tell. Responses can be sent to me at trsvax!techsup!bbimg!mikey or to Mr. Stoner, who was the author of the article.

Any mail sent to me will just be forwarded to Mr. Stoner at his Compuserve address.

Just for info, the responses on HAMNET of Compuserve have been very positive, the only concerns seriously addressed as of this posting have been about 6 meters and model airplane people.

Anyway, the text follows

mikey N1DVJ

the owners of personal computers
)
)
TO: The members of the Commission)

PROPOSAL FOR THE CREATION OF THE PUBLIC DIGITAL RADIO SERVICE

FILED BY
Donald L. Stoner, W6TNS
October 20 1985

SUMMARY OF PETITION

This petition is to identify the need for a new class of radio service. This radio service is described in the petition as the PUBLIC DIGITAL

RADIO SERVICE.

The petition shows that creation of the service and the allocation of spectrum is in the public interest, convenience and necessity.

Presently, computer-to-computer communication by the general public is confined to the telephone network. Millions of computer owners find that it is increasingly expensive to utilize this network to satisfy their communication needs.

Establishment of the PUBLIC DIGITAL RADIO SERVICE would permit the owners of personal computers to communicate by radio. Instead of a traditional channelized scheme, the petition describes a radio Local Area Network (LAN). The PUBLIC DIGITAL RADIO SERVICE permits an infinite number of local area radio networks to be interconnected into a national packet radio network.

The PUBLIC DIGITAL RADIO SERVICE would allow computer owners to exchange messages, bulletins, computer programs and other information by radio, and at no cost.

The petition describes how the Commission could create the PUBLIC DIGITAL RADIO SERVICE, which will adequately serve the needs of the public for at least the remainder of this century.

BACKGROUND OF PETITIONER

I have been a radio amateur (W6TNS) since 1954. A large part of my career has been devoted to the field of writing. For an extended period, I was the Novice and Technician editor of CQ Magazine. I have written hundreds of articles and authored several books on the subject of amateur radio and computer communications. I was also responsible for the idea which grew to become the OSCAR satellite, and I was able to make useful contributions to the program during its early stages. I have been an educator and taught at Chaffey College in Southern California.

This experience provided an opportunity to observe and study personal motivation, goals, effort versus reward, and so on. During the 70's I was involved in the manufacturing of Citizens Band communictaions equipment. Thus, I was able to write about CB initially and then participate in its "self destruction". The experience afforded the opportunity to see what "went wrong" and, with hindsight, to realize how to avoid these mistakes in the future.

In 1983, I made a reply comment to PR Docket No. 83-28. This was the controversial "No-Code" document. As part of my reply, I proposed "THE CREATION OF A COMPUTER HOBBYIST LICENSE CLASS".

It was (and is) my contention that this license class would have brought in literally millions people into amateur radio. However, the amateur fraternity decided that no amateur radio licenses should be granted, under any circumstances without a Morse code examination.

Clearly, the proposal for a "computer radio band" received considerable attention on the part of the Commission. In its decision relative to Docket 83-28, the Commission left open the possibility of a radio service for computer hobbyists. However, radio spectrum was not allocated for such a service.

It is the purpose of this document to further amplify the need for such a service, to make a recommendation on spectrum allocation, and to outline technical specifications which will ensure the successful introduction and usage of the PUBLIC DIGITAL RADIO SERVICE.

The accumulated knowledge of the writer has provided certain insights, many of which have contributed to the preparation of this document. A careful and serious consideration of my petition by the Commission is sincerely appreciated

THE PETITION

Why Is A Computer Radio Band Needed? The increasing popularity of personal computing is well known. There are presently more than 18 million of these devices in the hands of the public. Today, a computer can be purchased for less than $100. Thus any American, rich or poor, can afford to own a personal computer. Many experts feel there will be a ten-fold increase in the acquisition of computers by the end of this decade.

The Commission is aware of the popularity of computers. High frequency digital circuits produce radio and television interference. The Commission recognized the growth in the personal computer market and regulated interference levels before an untenable situation occurred.

The Commission is also aware of the popularity of computer communications via the telephone network. As a result of the "Carterphone Decision", there has been an enormous increase in type acceptance applications for telephone modem devices. According to Creative Strategies International, a Cupertino Calif., research firm, the modem market will reach $555 million by the end of 1985 and is expected to top $1.5 billion by 1988. The bulk of these telephone modem sales are to the owners of personal computers. It is presently possible to purchase an FCC approved modem for as little as $29.95. If one assumes an average price of $100.00, there will be 15 million modems in use by the end of this decade.

Why do owners of personal computers utilize modems? The desire to communicate with others having like interests does not diminish with the acquisition of a computer. Computer owners like to play interactive games, exchange messages and software, assist others having like computers, and so on. This desire to communicate has provided the basis for a number of national information utilities such as The Source, CompuServe, PlayNet, Delphi and The Shuttle. These organizations allow computer owners to interconnect and exchange all manner of information via the national telephone network. These

services are extremely popular. CompuServe, for example, claims to have 250,000 members.

The exchange of information between computer owners is not free, however. These information utilities charge hourly fees varying between $3.00 and $20.00, depending on time of access and the data rate.

More relevant to this discussion is the cost for the transport medium, the telephone network. In the previous decade, the cost of a computer was relatively high while telephone costs were relatively low. In this decade the situation has reversed. Telephone companies are begining to implement charges based on time and distance for local calls. Thus the cost to the public for computer communications will increase significantly.

Recently, a number of telephone companies attempted to impose a surchage on those using modems. Some modem users have added an expensive second telephone line. Without this alternate path, the telephone is essentially out-of-service while the user is on-line with the computer. Thus the user is unable to receive emergency calls. At the slow data rates prevalent on telephone networks, these periods can be quite lengthy.

It should be stressed that much of the existing and future computer communications could be handled by suitable radio devices. Recently there has been a significant increase in the interest and use of radio waves to transport computer data. The trade press regularly mentions companies trying various approaches which avoid the use of telephone lines for data communications. The most common activity seems to be the use of FM subcarriers for point-to- multipoint networks.

Motorola has been a leader in the area of point-to-point data communications. They offer a wireless data system which allows portable-computer owners (possessing Motorola cellular-radio telephones) to transmit data at speeds up to 1200 baud.

Motorola has also supplied a hand-held terminal for IBM field engineers. It allows two-way communication with a central tranmitter and computer.

Finally, Motorola has recently petitioned the Commission to share satellite frequencies in the 1.7 gHz. range to create local area business radio networks.

All of the above products benefit the business community. They are designed to make businesses more profitable, productive and/or efficient by transmitting computer data via radio.

None of the products described above are intended to benefit the general public. The PUBLIC DIGITAL RADIO SERVICE can make personal computers more useful, interesting and/or productive to the general public. It is in the public interest, convenience and necessity that

the public also have access to this precious resource called the radio spectrum.

While modem communications will continue to be popular, an alternate cost-free communication path should be available to the computer public.

This document describes such a service, called the PUBLIC DIGITAL RADIO SERVICE. It petitions the Commission to create such a service with suitable regulations and to allocate sufficient spectrum to insure the success of the service.

TYPE OF SERVICE PROPOSED

In the past, there has been some discussion of permitting computer communications on the Citizens Band. CB usage and channel loading is currently a fraction of what it was during the previous decade. Four additional CB frequencies, formerly used for the remote control of objects, are virtually unused. Other bands (in particular, 49 and 72 mHz) could accomodate computer communications.

In the above examples, a channel scheme is implied. The use of communnication channels, however, leads to ham type operations ("send the data to me on channel X"). Channelized operation and shared services would probably not work for the PUBLIC DIGITAL RADIO SERVICE. The users of this service will expect operation and performance similar to that of a telephone modem. Telephone modems do not have channels.

The computer public is not interested in the radio aspects of communication other than as a means to an end. Thus there is no need or desire for voice communications as part of an equivalent radio modem. This precludes the "chit-chat" type of operation which was destructive on the Citizens Band.

Sharing frequencies with voice communication (such as on CB) would be unacceptable. Interference, caused by frequency sharing, would garble the received data. Since the interference is transparent, the typical user will assume that data errors are caused by equipment faults. Thus, it is essential that the frequency allocation for the PUBLIC DIGITAL RADIO SERVICE not be shared with any other service.

Channelized plans inevitably lead to a further problem. If the service becomes popular, there will ultimately be a need for more channels. This is exactly the situation which occurred on the Citizens Band. The Commission is well aware of the problems which resulted from the disruption of adding additional CB channels.

The alternative to a channelized scheme is to send the data at high rates using packet technology. A single wideband channel can be thought of as a digital highway with addressed packets entering and leaving the route in a highly organized manner (see "What Is A Packet Radio Network?").

AN ALLOCATION OF SPECTRUM FOR
THE PUBLIC DIGITAL RADIO SERVICE

A wideband digital channel can only be accomodated within the VHF band or higher frequencies. To keep the cost of equipment low, a band between 30 and 300 mHz is ideal. Some readers may feel that a service as described should be placed in the UHF or SHF range. This might be true if a suitable allocation within the 30-300 mHz band did not exist.

However, within this frequency range there is a band, 2 mHz in width, which is virtually unoccuplied and therefore unused. I refer to the spectrum between 52 and 54 mHz. Radio amateurs are permitted to operate on frequencies between 50 and 54 mHz (the six meter band). For a number of reasons, this band is "underoccupied".

It is estimated that out of 400,000 radio amateurs in the United States, less than 1,000 are active on the six meter band.

Due to the potential for inteference with adjacent television channel 2 (54-60 mHz), virtually all six meter users operate between 50 and 52 mHz. For all practical purposes the radio spectrum between 52 and 54 mHz is wasted.

The radio spectrum is a precious natural resource much the same as our beaches and national parks. The public access to the radio spectrum resource is severely limited. The entry fee is an amateur radio license. This can be justified in instances where the resource is severely limited or where national security is involved. It cannot be justified by any stretch of the imagination when the beach or park is totally deserted!

POTENTIAL FOR TV INTERFERENCE

The Cause of Interference- Radio amateurs have not used the 52.0- 54.0 mHz portion of the six meter band due to the high risk of television interference. This interference problem occurs through no fault of the amateur or the transmitting equipment.

A typical ham six meter transmitter can induce several volts of radio frequency energy in a nearby television antenna. The induced voltage can be thousands of times stronger than the television station being received. Thus, the strong signal from the ham station can overload the TV receiver.

This effect is called crossmodulation and can cause interference on all channels. The level of interference can vary in intensity from "crosshatching" to a total loss of the picture.

Radio amateurs have access to many bands of frequencies throughout the radio spectrum. None of the other bands share the close proximity to television channels as does the six meter band. Clearly, amateurs have resolved the problem of television interference simply by not using this portion of the six meter band.

To date, no one has addressed the problem of using these frequencies in a manner which will not cause television interference.

This portion of the spectrum could be utilized by reducing the power output of the transmitter below the point where television interference can occur.

Eliminating Interference- It is the opinion and experience of the writer that no televison interference can occur from a radio modem operating in the 52.0- 54.0 mHz band if the following conditions are met:
1. The signal strength of the TV station being received exceeds 100 uvolts.
2. The effective radiated power of an adjacent radio modem does not exceed one watt.
3. The separation between the radio modem antenna and the television antenna exceeds 8 meters.
4. The radio modem antenna is vertically polarized with respect to the horizontally polarized TV receiving antenna.
5. All modulation and spurious products which fall outside the authorized bandwidth conform to the FCC 43 plus 10 log10 rule.

If these conditions are met, the 52.0- 54.0 mHz band will be suitable for the PUBLIC DIGITAL RADIO SERVICE and no significant television interference will occur.

WHAT IS A PACKET RADIO NETWORK?

The reader may be familar with the term "local area network" (LAN). In this system a limited number of computers are connected together by cable in a manner which permits intercommunication. A packet radio network is an infinite number of LAN's connected together by radio waves.

A packet radio network may be thought of as a digital equivalent of the U.S. Postal Service. The information to be sent to another computer is equivalent to a letter. The letter is placed in an envelope which includes a destination address. This is called the packet. This packet is sent along with those of other users into the network, which acts like a mailbag.

The packet address also includes something like a postal zip code. The postal analogy varies somewhat in the handling of messages. Each radio modem connected to the network is a destination mailbox. At the same time it can also act as a "post office" for others connected to the network.

Each user is considered to be a "node" in the PUBLIC DIGITAL RADIO SERVICE. These stations or nodes constantly monitor the transmissions (mailbags), looking for packets (envelopes) which are addressed to them. If a message addressed to the node is detected, it is held in memory (the recipients mailbox).

The message may be intended for a nearby node as indicated by the "zip code". In this case, the node "mailbox" does not activate. Rather, the node becomes a "post office" and passes the message to one or more other nodes. The reply from the destination computer is handled in the same manner but the direction is reversed.

Packet radio transmission (movement of the "mailbags") can occur at very high speed. In fact, the speed is only limited by the bandwidth of frequencies alloted to the network. This petition requests a band of frequencies 2 mHz in width. This is sufficent to handle data rates in excess of 1 million bits per second. When one considers that the typical rate of data transmission on a telephone network is 300 bits per second, it can be seen that the PUBLIC DIGITAL RADIO SERVICE can handle a large number of simultaneous users.

Unlimited Users- Actually, the number of simultaneous users is unlimited due to an advantage of FM radio transmission called the "capture effect". Each node will "hear" (or capture) only the strongest stations in the immediate area of the node. More distant stations will be inaudible and will not cause interference. Thus users in two adjacent cities (for example) can communicate within the cities without interference from users in the adjacent city. Of course, if it is desired to send a message to a user in the adacent city, the appropriate nodes will repeat the message until it reaches the destination and triggers a delivery acknowledgement. Other messages, not addressed to the adjacent city, will be ignored.

WHAT IS A RADIO MODEM?

The device to control the node (see previous section) functions similar to a ham radio "digipeater" but at a much higher speed. Since the the term "digipeater" has no significance to the general public, the node controller is refered to as a "radio modem".

What is it?- Technically speaking, the radio modem is a non-persistent, carrier sense, multiple access with collision avoidance device. In practice, the radio modem consists of a small box, whip antenna and coaxial cable. The unit contains a receiver and transmitter, in addition to an RS-232 computer interface.

In addition to acting as a transceiving device, the radio modem is also capable of repeating received packets on the basis of a stored algorithm. In other words, it will receive, store and retransmit messages along the addressees route. Note that it is capable of acting as a repeater even if it is not connected to a computing device.

Training- Upon activation, the radio modem executes a stored training sequence. When first installed, the radio announces its presence and digital address in the network. The radio modem transmits its position with respect to other units, determines the digital address of other nearby units and finally, adjusts its power output to the minimum required to maintain communications with the other nearby units. This

power can vary from 1 milliwatt for densely populated areas to the 1 watt maxiumum in rural areas. It is essential that the radio modem transmit only sufficient energy to maintain contact with other nearby radio modems (nodes).

Training the radio modem for power output insures that a minimum signal level is radiated by the antenna. The purpose is to minimize the possiblilty of television interference. Some readers may point out that one watt is simply not enough power for rural areas. However, it is not the purpose of the PUBLIC DIGITAL RADIO NETWORK to duplicate the elaborate trunks of the public telephone network. There are bound to be areas which cannot pass messages. Under no circumstances should consideration be given to increased power output in these instances. If a high power mode is available, it will be abused.

A COMPARISON WITH CB RADIO

Those reviewing this petition may have a tendency to make comparisons with the introduction, usage and the degeneration of the 27 mHz Citizens Radio band.

The following points are presented with this comparison in mind. No one, including the petitioner, would like to see the PUBLIC DIGITAL RADIO SERVICE meet the same fate as the 27 mHz Citizens Band.

There is a major reason for the chaos which developed on the 27 mHz Citizens Band. The licensees of this service did not feel it was in their interests to abide by the Rules and Regulations. We can learn from this experience by designing a service where Rule compliance is in the interests of the user.

MODULATION- There must be no provision for voice communications in the PUBLIC DIGITAL RADIO SERVICE. Users of radio modems wish to exchange digital data, not the spoken word.

IDENTIFICATION- Enactment of a PUBLIC DIGITAL RADIO SERVICE will not affect the licensing workload of the Commission. Services which are essentially self-regulating (such as the remote control of objects, garage door openers, etc.) do not require the use of call letters. Inherent in the addressability of the radio modem, is a built-in aid to compliance and enforcement. Each radio modem has its own unique identification code, that is, its packet address. This is both the serial number and digital address of the unit. This code also identifies the manufacturer and the physical location of the radio modem. Violations of technical requirements can be easily be correlated by manufacturer. In other words, if a significant number of units are observed to be defective, the manufacturer can be immediately determined by serial number correlation.

If a unit is found to be non-complying, a message can be addressed to that radio modem advising the user of the problem. The Commission personnel sending the message receives the customary delivery acknowledgement of the message. Thus there can be no question that the

user received the Notice of Violation.

POWER OUTPUT- A major contributing factor to the "CB problem" was the addition of power amplifiers to CB radios in an effort to increase the talk range.

Adding a power amplifier to a radio modem will produce no increase in performance. The unit will "retrain" to reduce its power output to maintain the nominal signal level at nearby radio modems. Thus, the power delivered to the antenna might be 50 milliwatts (as an example), with or without the power amplifier.

ANTENNA- To further increase transmitting range, high gain, directional antennas were connected to CB radios. If the same type of antenna were connected to a radio modem, it would result in a "negative improvement". There would be no increase in range, since the radio modem would retrain to produce the nominal signal strength at nearby nodes. More important, the radio modem connected to a directive antenna could miss messages arriving from directions other than the antenna principal gain lobe. By the same token, raising the elevation of the antenna would cause no noticable increase in communication range.

OFF FREQUENCY OPERATION- Illegal out-of-band operation caused sizable headaches for the Commission enforcement personel. This will never be the case with the PUBLIC DIGITAL RADIO SYSTEM however. There is only one "channel" or band. If, by some means, the frequency of a radio modem were lowered, the data would be destroyed by amateur radio transmissions. If it were raised, video information from TV channel 2 would do the same thing.

TECHNICAL SPECIFICATIONS

The "radio modem" (node controller) to be used in the PUBLIC DIGITAL RADIO SERVICE shall meet the following specifications:

FREQUENCY BAND- Equipment authorized to operate in the PUBLIC DIGITAL RADIO SERVICE shall be capable of receiving and transmitting data within the band from 52.0 to 53.999 mHz.

MODULATION- The data shall frequency modulate the carrier in a frequency shift keyed scheme. Under no circumstances will equipment authorized for use in the PUBLIC DIGITAL RADIO SERVICE have provision for voice modulation or detection.

MODULATION AND SPURIOUS PRODUCTS-

The data rate (see Note 1), waveform and signal processing shall be such that all products which fall outside the authorized bandwidth be suppressed by 43 plus 10 log10 (mean output power, in watts) decibels.

POWER OUTPUT- The power delivered by the final amplifier stage into a 72 ohm load shall not exceed 1.0 watts. Further, the radio modem (node

controller) shall have an initial powerup "training" mode. Upon powerup, the power output will be 1 milliwatt.

The power will increase during "training" in 3 db. steps until contact is established with nearby radio modems (node controllers). This value is stored in memory and becomes the nominal power output for the radio modem.

ANTENNA- The antenna shall consist of a vertical radiator which does not exceed one-quarter wavelength. The antenna shall exhibit no gain or directional characteristics. The antenna shall be supplied with a nominal length of coaxial cable.

TRANSMITTER IDENTIFICATION- Each radio modem shall have an imbedded identification which is transmitted as part of its packet address. The address will be used to identify the manufacturer, the serial number and the routing code of the equipment.

PACKET CONSTRUCTION- The packet and destination address will be contained in the header. The header will be constructed to limit the number of destination addresses. This is done to specifically preclude the transmission of "junk mail".

REMUNERATION- Users of the PUBLIC DIGITAL RADIO SERVICE shall be specifically prohibited from receiving any form of remuneration or compensation, either in the form of funds, goods or services, for handling data on the PUBLIC DIGITAL RADIO SERVICE (see Note 2).

TYPE ACCEPTANCE- Type acceptance procedures, similar to those for Citizens Band equipment, will be required. This insures that commercially manufactured equipment used in the PUBLIC DIGITAL RADIO SERVICE meets the specified technical requirements for this service.

NOTE 1- No data rate is given in these proposed specifications. It should be left to industry to determine the data rate. Schemes, unknown to the writer or Commission, may permit higher rates within the authorized bandwidth than conventional theory would dictate.

NOTE 2- The purpose of this provision is to prevent the use of the PUBLIC DIGITAL RADIO SERVICE for the benefit of common carriers. The restriction should not be construed to preclude the use of the PUBLIC DIGITAL RADIO SERVICE for business applications. For example, the radio modem would be extremely useful within buildings to avoid the need for local area network cabling. It is likely the signals of an office radio LAN would not connect to the external PUBLIC DIGITAL RADIO SERVICE.

The reader might envision that the service would be usurped by the business community. This is not likely, however, due to the self-regulating nature of the PUBLIC DIGITAL RADIO SERVICE. Businesses are used to the near instantaneous response of telephone data communications.

In comparison, the message response of a packet radio network is relatively slow. Only small businesses would find these delays tolerable. These are the same business which can least afford the increase in telephone rates.

There is an analogy in the use of the Citizens Band. Numerous channels are available and the equipment is quite inexpensive. Even so, this band is seldom used for business purposes. There are simply too many disadvantages for the business community.

CONCLUSION

In response to this petition, the Commission may point out that there has been no popular "groundswell" to create a computer radio service. Likewise, there was no public interest in the creation of a television service in the 30's. However, in 1932, the Commission recognized the significance of television and allocated two bands for development of this new technology.

By the same token, the Commission recognized the impact that FM radio broadcasting would have on sound reproduction. In 1941 they allocated an eight mHz band to bring high fidelity sounds to the public.

In either case, there was very little awareness that such technologies were possible when the allocations were made.

The creation of a PUBLIC DIGITAL RADIO SERVICE is another instance where the Commission could take the initiative and create a new service in keeping with current technology.

International Regulations- Since the allocation is above 50 mHz, it appears that no international treaties would be involved in making the proposed allocation. Rather, it is likely that other countries would develop a similar service for their citizens.

Amateur Radio Opposition- It is safe to assume there will be sizable opposition to this petition by amateurs. The writer has been a radio amateur for 30 years. During this period, no permanant allocation has been "taken away" from the amateur radio fraternity.

However, there can be no defense by amateurs of the inactivity on 6 meters. A reallocation of the frequencies requested would benefit the majority at virtually no expense to the minority.

Amateur Radio Colaboration- The principal purpose of this petition is to obtain an allocation for a public computer communication band. The writer would not object if this goal could be achieved as part of the Radio Amateur Service. The computer public would accept an administrative fee in return for access to the radio spectrum. However, they would never accept any sort of "testing" to achieve this goal.

The writer would like to thank the Commission for the opportunity to

submit this petition. Further, the writer appreciates the consideration this petition will receive by the members of the Commission.

My parents are involved in a volunteer fire department in an Austin suburb. They have mobile transmitters (148-174 Mhz) for their cars, but often find that a hand held unit would be more useful. (You can't fight fires very well from your car...) They're looking for something which is:

rugged and reliable   (is likely to be used under sub-optimal conditions)
reasonably priced   (not necessarily cheap, just good value for the $)
reasonable to service (hopefully never needed, but....)

Transmission and reception quality are obviously important, too. A design which would allow easy operation with gloves on would be desirable. Most of the use would be for on-site communications, so high power isn't a huge consideration, though it would certainly be a nice bonus.

A local dealer is trying to get them to buy the Maxon line. I've never heard of this company, and would be very interested to hear any comments you might have about their products. Comments, favorable or unfavorable, about Maxon or other brands would be appreciated. Thanks in advance for any help. Since this isn't likely to be of general interest, it's probably best to

respond to this via email.

Regarding K9UN's request for HF beacon station listings, there are
20m beacons used in a worldwide network sponsored by a big DX assoc.
(Northern Calif or some such.)
They are at: (slot #, location)

```
     0 New York    1 San Francisco        2 Hawaii
     3 Tokyo       4 Israel      5 Helsinki
     6 Madiera Isl.     7 Johannesburg, S. Af.  8 Buenos Aires
     9 Medillin, Columbia
```

Each transmits for 1 minute at all times which end with the slot #,
thus NY at hh00 hh10 hh20 hh30,hh40,and hh50;
Tokyo at hh03,hh13,hh23 etc. The system is on continuously.

After CW ID they give tones for a few seconds each at 100w output,
10w, 1w and .1w., then a final ID. They operate on 14100 khz, and
all are within about 50 hz or so, the CW pitch changes just a little
as they cycle through. The start and stop times seem to be controlled
to within about 2 seconds of nominal. If one sets a well calibrated
HAM receiver with a narrow filter at 14100.0, normally one will hear
several of the 10 at just about any time. The South American stations
in slots 8 and 9 are new, may not yet be on air.

I also have a FORTRAN program that predicts when you should be able to
receive them base on the solar_flux. It is a program written by Mort,
KA1IU, based on the MINMUF program for predicting the best time of

the day from your location to receive these beacons. One mode of the program calculates the MUF for the beacon locations, along with a number of other locations (a total of 21), including WWV in Colorado. The output is in tabular form for hourly time intervals at a selected solar flux level. I tried to send this directly but must have your electronic mailing address wrong.

In the January,86 issue of QST, the ICOM IC-735 HF transceiver was
'reviewed' in their Product Review section. Specifically designed
for mobile/portable operation, QST's 'review' of the IC-735 failed
to address substantive issues, even the most fundamental
mobile/portable-specific operational features of the IC-735 which
either enhance or degrade it's application to this unique subset
of amateur radio.

For the past four years I have been using an IC-720A, in a dedicated
mobile environment, which, at the time it was purchased, was considered
to be the 'top-of-the-line' of the ICOM offerings. In practice, however,
even the most basic features, such as adequate undistorted audio output,

or even more importantly, an effective noise blanker for the mobile environment, were not, in my opinion, considered adequately in the design of this transceiver. A thorough product review would have provided at least substantive guidelines so that in its application to a particular operating environment, a knowledgeble choice could be made.

I am once again searching for another HF transceiver for dedicated mobile operation. If anyone can identify a sound product review with substantive information, addressing the noise blanker, selectivity, and certainly, mobile ergometrics, I would greatly appreciate your effort.

Back in November, I posted a message in this newsgroup about broadband noise (ranging from about 2 to 12 MHz) that would ruin my shortwave reception. I would like to thank the many people who responded.

As a number of people suggested, I drove in my car with a portable receiver looking for the source. I was able to track the noise to a power company transformer sitting on one of their poles about a kilometer from my house. If I stood near the pole, I could hear it buzzing with the identical noise pattern that I heard from my receiver.

I called the JCP&L (the local power utility) trouble number and reported the problem, giving the pole number (attached to the pole) and its location. Surprisingly, they came and fixed it that day.

My conclusion is that JCP&L is indeed responsive to fixing these problems. Doing a bit of their work myself, by determining where the problem was, probably helped speed things up.

What follows are my initial reactions to the Stoner proposal for creation
of a Public Digital Radio Service. Since I do not have access to Compuserve,
I'd appreciate it if somebody forwarded this note to Don Stoner.

I agree that the time has come for such a service. As involved as I am in
the development of amateur packet radio, I can see plenty of legitimate
applications for low cost, personal digital radio communications that
properly lie outside the scope of the Amateur Service (e.g., business use,
need for encryption, etc). Further, the need for such a service is enhanced
by the amateur community's continuing opposition to any form of "no code"
license, an irrational attitude that will surely prevent packet radio from
ever reaching its full potential in the Amateur Service.

Having said this, however, I must take issue with the details of Stoner's
proposal, in particular his frequency and bandwidth recommendations. As a
radio amateur, I instinctively resist the "giving away" of any amateur
allocation, even one as lightly used as 52-54 Mhz. I am also not convinced by
Stoner's contention that an inexpensive radio modem, particularly one with
an emission bandwidth of 2 megahertz, could be operated without interference
to nearby TV receivers tuned to Channel 2. At the very least, I would like
to see the results of any tests he has conducted to reach this conclusion.

Another problem I forsee with such a large allocation, which apparently would
be used for a single, wideband RF channel, is multipath dispersion.
The DARPA packet radio community has found that packet radios operating
in a typical urban or suburban environment are effectively limited to
data rates of 100 to 400 kilobaud because of the intersymbol interference

caused by multipath propagation effects. Only when a strong line-of-sight signal component fully captures the receiver is it possible to operate at higher speeds. Therefore, it is clearly not necessary to allocate such a wide portion of spectrum if the intent is only to provide a single RF channel.

I think that Mr. Stoner's proposal would be an excellent one once he finds another, smaller, piece of spectrum outside the amateur bands to use.

Phil Karn, KA9Q

Hi,

Is there anything that can be done to reduce the RF hash radiated
by TV sets (usually color)? Some of the local SWLs and I are bothered
by TV sets in our own homes. Moving the SW antenna is sometimes helpful.
Has anyone tried extra bypass capacitors in the TV receiver? Is this
hash radiated through the power line or TV antenna?

Please DO NOT post your responses. Mail them to me and I will summarize
to the net.

Thank You

Bruce Perens

December 19, 1985

The ARRL Letter is published bi-weekly by the Information Services Department of the American Radio Relay League, 225 Main St., Newington, CT, 06111; (203) 666-1541. Larry E. Price, W4RA, President; David Sumner, K1ZZ, Executive Vice President; Dave Newkirk, AK7M, Editor; Debra Chapor, Circulation Manager.

Information from The ARRL Letter may be reproduced in whole or part in any form including photoreproduction and electronic databanks, providing credit is given to The ARRL Letter and to the American Radio Relay League.

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds) per year for First-Class Mailing to the U.S., Canada, and Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

In this issue:

o PRIVACY ACT DOES NOT TARGET PHONE PATCHES

o LEAGUE OPPOSES LOW-POWER 902 MHz VIDEO LINKS

o NEW THIRD PARTY AGREEMENT WITH 4U1VIC

o ...and much more!

PRIVACY ACT DOES NOT TARGET PHONE PATCHES

We first mentioned the Electronic Communications Privacy Act of 1985 in the November 7 Letter. Here's more. This League Lines item is preprinted from January 1986 QST and is copyright (C) 1985 by the American Radio Relay League, Inc:

In communications to ARRL and to their representatives in Congress, amateurs are running up verbal "hurricane warning" flags regarding the Electronic Communications Privacy Act of 1985, S. 1667 and H.R. 3378. "Small craft warnings" would be far more appropriate: The bill indeed requires some attention from the amateur community, but it poses far less threat to amateurs than some people think. More next month, but for now be assured that: (1) the bill does not propose to outlaw phone patches; (2) it would not make possession (by anyone) of any kind of equipment illegal; (3) the bill can't possibly reach the House (or the Senate) for a vote before February or later; and (4) ARRL is working closely and personally with Committee staff to smooth out rough spots.

ARRL had been asked to testify at a December 5 hearing scheduled by the House Subcommittee on Courts, Civil Liberties and the Administration of Justice on the Electronic Communications Privacy Act of 1985, but that hearing will probably be rescheduled to January 29 or 30 of next year. Whenever, ARRL will be there. Why was the hearing rescheduled? It was preempted by the Chairman of the full Judiciary Committee, Peter W. Rodino, Jr, D-New Jersey. The Judiciary Committee had received a 1400-page report on doings at the Environmental Protection Agency, and on a procedural point it was insisted that the entire report be read! Wrote ARRL's Washington Area Coordinator:

"Part way through the reading, after an hour or so, however, a compromise was struck, waiving the reading . . . so some useful purpose could be accomplished by the hearing. None of this is germane to our work; I mention it because I was fascinated, and also to show that the cancellation of the hearing on the Privacy Act was not part of solows:

(cc) Spread spectrum transmission. An information bearing transmission in which information is conveyed by a modulated RF carrier and where the bandwidth is significantly widened, by

means of a spreading function, over that needed totransmit the information alone.

Add a new Section 97.71, Spread spectrum communications, as follows:

(a) Subject to special conditions in paragraphs (b) through (i) of this section, amateurlows:

(cc) Spread spectrum transmission. An information bearing transmission in which information is conveyed by a modulated RF carrier and where the bandwidth is significantly widened, by means of a spreading function, over that needed totransmit the information alone.

Add a new Section 97.71, Spread spectrum communications, as follows:

(a) Subject to special conditions in paragraphs (b) through (i) of this section, amateur stations may employ spread spectrum transmissions to convey information containing voice, teleprinter, facsimile, television, signals for remote control of objects, computer programs, data, and other communications including communication protocol elements. Spread spectrum transmissions must not be used for the purpose of obscuring the meaning of, but only to facilitate transmission.

(b) Spread spectrum transmissions are authorized on amateur frequencies above 420 MHz.

(c) Stations employing spread-spectrum transmissions shall not cause harmful interference to stations of good engineering design employing other authorized emissions specified in the table. Stations employing spread spectrum must also accept all interference caused by stations of good engineering design employing other authorized emissions specified in the table. (For the purposes of this subparagraph, unintended triggering of carrier operated repeaters is not considered to be harmful interference. Nevertheless, spread spectrum users should take reasonable steps to avoid this situation from occurring.)

(d) Spread spectrum transmissions are authorized for domestic radio communication only (communication between points within areas where radio services are regulated by the U.S. Federal Communications Commission), except where special arrangements have been made between the United States and the administration of any other country concerned.

(e) Only frequency hopping and direct sequence transmissions are authorized. Hybrid spread-spectrum transmissions (transmissions involving both spreading techniques) are prohibited.

(1) Frequency hopping. The carrier is modulated with unciphered information and changes at fixed intervals under the direction of a high speed code sequence.

(2) Direct sequence. The information is modulo-2 added to a high-speed code sequence. The combined information and code are then used to modulate a RF carrier. The high speed code sequence dominates the modulating function, and is the direct cause of the wide spreading of the transmitted signal.

(f) The only spreading sequences which are authorized must be from the output of one binary linear feedback shift register (which may be implemented in hardware or software).

(1) Only the following sets of connections may be used:

Number of stages in shift register	Taps used in feedback
7	[7,1]
13	[13,4,3,1]
19	[19,5,2,1]

(The numbers in brackets indicate which binary stages are combined with modulo-2 addition to form the input to the shift register in stage 1. The output is taken from the highest numbered stage.)

(2) The shift register must not be reset other than by its feedback during an individual transmission. The shift register must be used as follows.

(i) For frequency hopping transmissions using x frequencies, n consecutive bits from the shift register must be used to select the next frequency from a list of frequencies sorted in ascending order. Each consecutive frequency must be selected by a consecutive block of n bits. (Where n is the smallest integer greater than log2 x.)

(ii) For a direct sequence transmissions using m-ary modulation, consecutive blocks of log2 m bits from the shift register must be used to select the transmitted signal during each interval.

(g) The station records shall document all spread spectrum transmissions and shall be retained for a period of one year following the last entry. The station records must include sufficient information to enable the Commission, using the information contained therein, to demodulate all transmissions. The station records must contain at least the following:

(1) A technical description of the transmitted signal.

(2) Pertinent parameters describing the transmitted signal including the frequency or frequencies of operation, and, where applicable, the chip rate, the code, the code rate, the spreading function, the transmission protocol(s) including the method of achieving synchronization, and the modulation type;

(3) A general description of the type of information being conveyed, for example, voice, text, memory dump, facsimile, television, etc.;

(4) The method and, if applicable, the frequency or frequencies used for station identification.

(5) The date of beginning and the date of ending use of each type of transmitted signal.

(h) When deemed necessary by an Engineer-in-Charge of a Commission field facility to assure compliance with the rules of this part, a station licensee shall:

(1) Cease spread spectrum transmissions authorized under this paragraph;

(2) Restrict spread spectrum transmissions authorized under this paragraph to the extent instructed;

(3) Maabove; narrow band identification transmissions must be on only one frequency in each band being used. Alternatively, the station identification may be transmitted while in spread spectrum operation by changing one or more parameters of the emission in a fashion such that CW or SSB or narrow band FM receivers can be used to identify the sending station.

NEW THIRD PARTY AGREEMENT WITH 4U1VIC

United Nations Vienna and the US government have concluded a thirdabove; narrow band identification transmissions must be on only one frequency in each band being used. Alternatively, the station identification may be transmitted while in spread spectrum operation by changing one or more parameters of the emission in a fashion such that CW or SSB or narrow band FM receivers can be used to identify the sending station.

NEW THIRD PARTY AGREEMENT WITH 4U1VIC

United Nations Vienna and the US government have concluded a third-party traffic agreement, effective January 2, 1986. The call sign at the Vienna International Centre is 4U1VIC, operated by the Vienna International Amateur Radio Club.
The usual third-party-traffic guidelines in Section 97.114 of our Rules apply.

JOB OPENING AT ARRL HQ

ARRL HQ is looking to fill a vacancy in the Regulatory Information Branch Manager position. Primary responsibilities

include editing The ARRL Letter and writing the Happenings and League Lines columns for QST, as well as updating The FCC Rule Book. The RIB Manager also answers phone and letter inquiries on a wide variety of regulatory matters, including antenna ordinances and FCC rules interpretations.

Applicants must have a General Class or higher amateur license; good writing ability and experience are required. A broad background in Amateur Radio and some supervisory experience would be helpful. Annual salary range $18,226-$25,506. If you feel you're qualified for this position, call Bob Halprin or John Lindholm at 203-666-1541.

LEAGUE OPPOSES LOW-POWER 902-MHz VIDEO LINKS

In the November 7 Letter we covered a petition by Jerry Iggulden of Valencia, California, requesting that FCC allow unlicensed operation of low-power video transmitters at 902-928 MHz. The idea behind the petition (RM-5193) is the operation of such transmitters to link video sources, such as VCRs, to television sets without the bother of interconnecting wires. Unlicensed low-power communication devices operate at quite a few places in the radio spectrum, it's true -- but this proposal would plunk strong video sources smack dab in our new 902-MHz band!

"Ungood," is ARRL's response. "The consumer would be ill-served by the proposal. The largest potential market for such consumer devices would be for use in single- or multiple-family dwellings in or near major metropolitan areas. The highest concentration of Amateur Radio stations also can be found in single- or multiple-family dwellings in or near major metropolitan areas." Such unlicensed devices must not interfere with any licensed services on any frequency -- and the projected 902-MHz devices would provide quite a front-end-full: "Calculations by the League's Technical Staff indicate that a radiated signal of the permitted intensity (50,000 microvolts-per-meter at 30 meters) would produce a voltage of over 540 microvolts at the receiver input of a good amateur station at a distance of 1 kilometer . . . at 10 kilometers, the predicted signal would be 54 uV/m. The amateur receiving such interference at ranges of over 10 kilometers would face the problem of indentifying one or multiple interference sources; calling on all neighbors within that range to determine which one(s) had installed such a video transmitter (a continuous-duty-cycle device when operated); and the difficult or impossible chore of convincing the consumer that the device should not be operated."

"Neither the Commission nor the manufacturers of garage-door openers should have forgotten the problems which arose when those devices were operated on frequencies adjacent to voice frequencies in the Citizens Radio Service and on frequencies assigned to the Aviation Radio Service . . . it would appear . . . that Part 15 Rules as presently stated sufficiently provide for the type of device proposed by Petitioner (on frequencies other than those assigned to the Amateur Radio Service), provided that all technical rules are observed."

ARRL's Comments in Opposition to Petition for Rule Making in RM-5193 end there, but we'll add something you already know: say such devices were allowed, did sprout all over the 902-928 MHz band in metro areas (although with the projected signal levels at 10km and beyond, rural amateurs would be hit with this, too) -- who would be blamed when your licensed amateur signal messed up someone's unlicensed video link, the video link that's supposed to accept harmful interference and not cause any? The answer's in your mirror: you.

CQ HOLIDAYS DE W1AW

Over the weekend of December 28 and 29, ARRL HQ staffers will put W1AW on the air on all HF bands for general contacts. The regularly scheduled biweekly transmission of Keplerian data at 2330 UTC on Saturday will be sent, but other scheduled transmissions may be preempted as activity warrants. Operation will begin at approximately 1300 UTC each day. All QSLs received for this operation will be answered with the distinctive W1AW QSL, including a commemorative "350 Years of Connecticut" sticker.

REACTION TO CANADIAN RESTRUCTURING

Last Letter's lead covered the Department of Communications' proposal for restructuring Amateur Radio in Canada. Initial reaction seems mostly favorable. There is strong feeling that the examination for the entry level Certificate A be substantial, and that DOC should offer a "Slow Code" certificate that, in conjunction with Certificate A, would give CW privileges on the HF bands.

CLOSE, BUT NO CIGAR

We correct two glitches in the last Letter:

In "Ad Hoc Committee on Spread-Spectrum Interoperability," page 3, the callsign of committee member Dick Bingham is W7WKR. Re the US/Korea holiday traffic (page 4), the traffic is limited to amateur stations in the Republic of Korea with the prefix HL9. Once again, this temporary third-party agreement is in effect for the period 0001 UTC December 20, 1985, to 2359 UTC January 4, 1986.

AND, AT YEAR'S END,

Speaking of holiday traffic: peace and enjoyment for the holiday season are wished you by the entire HQ staff.

Although I don't yet own one myself, I have had a brief
opportunity to play with the new Sony ICF-2020 (ICF-2001D
outside the US) and was very impressed.  It covers 150kHz-
30MHz am and ssb plus 88-136MHz FM (which includes BC and
aircraft).  It has all sorts of features, including 32
memories, a scanner, keyboard and manual tuning, alarm
clock/time, a synchrophase detector for automatic ECSS
enhancement of am signals (and it really works, too), and
it actually has a good rf section, too.

The list price is something like $289, although 47 Street
```

Photo (a local discount house) has it in their latest
catalog for $249.95. You may want to look at the
lastest (1986) issue of the World Radio/TV handbook,
which I understand has a review of this (and other)
receivers. (Despite the $17.50 price, this book is a
necessity for anything but the most casual SWLing, so
your friend should probably buy the book anyway).

A couple weeks ago (I'm backlogged on my postings!) Glenn Hauser, in his
weekly "World of Radio" program, mentioned that he had received a

report, sort of third or fourth-hand, that the Galaxy 1 satellite signal was being jammed in or from a source in Arkansas. This was supposed to be a threat against some or all of the premium pay-video services to not scramble their signals. I have heard nothing else about this before or since. Anybody have any info on this subject, have seen anything in writing about it, or have comments to offer?

Will

A while back, several articles discussed obtaining commercial broadcast "pulls" for use in linears....

1. Where does one find these things (I assume you don't simply call the local AM station es say "hi, I'd like your old tubes!".

2. What types of stuff are currently used/available?? Like everyone else, I'm interested in the 1.8 - 30 mHz SSB/CW/RTTY applications.

Finally, any one have any thoughts on "up-grading" a SB-220 for 1.5KW?? I was toying with the idea of throwing away the existing power supply (or atleast remoting it out of the cabinet) to make room for perhaps another (pair) of 3-500Z's es a something like a 4-400 driver.

Any thoughts?? Would I be better off to throw away the existing 3-500s es go with a single 8877? Anybody have a source (price) on 8877s?

I appreciate any input!!

All you Brass Pounders out there, please help!

What type of keys/keyers/paddles do you like? I've been using a J-38 straight key for years, and also an old Heathkit HD-1510 keyer.

But now, having used a friend's Bencher for a few weeks, I'm ready to look for a better key! Both the Bencher and the Vibroplex Iambic look like fine choices, and both are about the same price. But each has its strengths and weaknesses. I will eventually try both, side by side... but until I can (there's no Vibroplex dealer in Austin) I would welcome your comments and recommendations!

Owner's Report: Uniden/Bearcat 800XLT Scanner

Bob Parnass, AJ9S

Manufactured in Taiwan, the 800XLT is the first programmable Uniden/Bearcat scanner to cover a portion of the 800 MHz band. Covering 40 channels in 2 banks the 800XLT is specified to receive in the following ranges:

TTTTAAAABBBBLLLLEEEE 1111.... 800XLT Frequency Coverage

29	-	54	fm
118	-	135.975	am
136	-	174	fm
406	-	512	fm
806	-	912	fm

Only a portion of the new 902-928 MHz ham band is covered.

Differs From Past Models

There are several differences between this scanner and its Bearcat predecessors.

- There is only a single scan/search speed: fast!

- 800XLT channel banks contain 20 channels, not 10 as in previous models. Although we should be thankful for the inclusion of a channel bank feature, doubling the number of channels in a bank is a step backwards.

- Scan delay, channel lockout, and priority enable are indicated by separate, colored LEDs rather than the numeric display, making a colorful light show.

- Both the selectable scan delay and the priority sampling period are 3 seconds vs. 2 seconds in the older scanners. Although a matter of personal preference, I like the 3 second scan delay, but would opt for a 1 or

2 second priority sampling period.

- Despite claims on the 800XLT box to the contrary, a 2 digit channel counter is displayed while scanning, as in the BC350, rather than "rolling zeroes" of the BC210/220/250/300. This is unfortunate, as rolling zeroes make it easier to discern what channels are locked out from scanning without having to step through each one manually.

- The keyboard has a good feel, although quite different from the "chicklet" keyboards on Bearcat 250 and 300 scanners. Keys travel further, with less of a positive click. The 800XLT keyboard is much easier to read, as each key has its function printed right on the keytop, rather than labeled above it on an inlay.

- The 800XLT seems to lack "window detection" circuitry, so the scanner may stop prematurely (off frequency) in the SEARCH mode.

- There is no date of manufacture stamped on the cabinet.

- Mobile DC power cord is optional, but is supplied as standard equipment with other Bearcat scanners.

Inside Appearance Pleasing

The inside of the 800XLT consists of 3 circuit boards:

1. a main receiver board, containing vhf/uhf front ends, IF stages, audio amplifier,

2. a feature board, containing microprocessor and key-board logic, and

3. an 800 MHz front end board, which uses surface mount components.

The boards appear very neat, and it is obvious that computer aided design and automated component insertion techniques were used. What a welcome change from the chaos inside a hand assembled BC250!

No schematic diagram is furnished. Whereas the identity of many of the ICs in earlier Bearcat scanners was obscured by the use of "house numbers", the ICs in my 800XLT are clearly marked with their original designations (e.g. National LM382). This makes repair easier, as one may obtain parts

from several sources rather than being forced to buy from Uniden.

Side-by-Side Performance Comparison

Side-by-side tests were performed, switching a Butternut SC3000 tri-band antenna at 20 feet among 3 scanners: the 800XLT, a new Bearcat 260, and an old Bearcat 300 workhorse. The test equipment used was a pair of human ears, which we all use when scanning.

As the following table shows, the 800XLT was more sensitive on some frequencies, but suffered much more overload from strong signals. This is important if the 800XLT will be used with an outdoor antenna. The 800XLT had fewer annoying birdies than the other models tested.

TTTTAAAABBBBLLLLEEEE 2222.... Performance of Bearcat 800XLT vs. 260 vs. 300

Band	Bearcat 800XLT	Bearcat 260	Bearcat 300
30-37 MHz	more sensitive	more sensitive	less sensitive
	weak birdies	moderate birdies	moderate birdies
	overloaded by paging, police mobile phones	no overload detected	no overload detected
37-50 MHz	equally sensitive	equally sensitive	equally sensitive
	overloaded by paging, police mobile phones	no overload detected	no overload detected
vhf aircraft	more sensitive	N/A	less sensitive

vhf-hi	slightly more sensitive	slightly more sensitive	slightly less sensitive	
	overloaded by paging	no overload detected	no overload detected	
	heard 162.55 wx on 147.19 and elsewhere			
uhf	more sensitive	less sensitive	less sensitive	
	overloaded by paging	no overload detected	no overload detected	

On the 800 MHz band, several police, business and cellular telephone stations were received using the supplied 3" antenna. Clear reception of a repeater used to dispatch Chicago Tribune photographers was possible from 50 miles distant.

The 800XLT audio output is clean and strong, with little synthesizer whine.

Early Problem Fixed: Memory Loss

My 800XLT lost its memory contents when unplugged from 117VAC, even though loaded with a fresh pair of alkaline AA batteries. The problem was traced to a metal contact, installed backwards in the battery holder. Repair required desoldering a red wire, repositioning the contact, then resoldering the wire. No further memory problems have been encountered.

Too Much Hysteresis in Squelch

There is too much "free play" in the stock 800XLT squelch control, the same affliction designed into Radio Shack scanners. The remedy consists of replacing the

860K ohm resistor on pin 14 of the MC3359P IC with a 2.2M ohm resistor.

Not As Selective as Older Bearcats

At -55 dB @ +- 25 KHz, the 800XLT IF selectivity is not as good as the BC350 and BC300, which are rated at -60 dB @ +- 25 KHz. The wider selectivity causes the scanner to stop prematurely in the SEARCH mode, and makes it difficult to determine, for example, if a station is transmitting on 855.2500 as opposed to 855.0125 MHz.

Since the 800XLT tunes in 12.5 KHz steps on the 800 MHz band, the wider selectivity is handy when scanning telephone cell sites, which are on channels spaced on 30 KHz apart.

Overall Evaluation

The 800XLT is the most conventional and easiest to operate of the new 800 MHz-capable scanners. It is plagued neither with the slow scan/search rate of the Regency MX7000, the low audio output of the MX4000, nor the unfriendliness of the Yaesu scanning algorithms.

The 800XLT's tendency to overload on strong signals and awkward squelch action detract from an otherwise good performance.

I think you'll find that most power companies will respond fairly
soon to a 'noisy' transformer. From what I was told by a power company
official, a 'noisy' transformer is a failure getting ready to happen.
Not only could the power company open up a can of worms if there
was a problem with loss of property or life from a failure that was
known to be imminent, but I'm sure a 'noisy' transformer is not as
effecient as a correctly functioning one. Also, the cost of rewinding
a transformer before it blows and damages the core is considerably less
than after the failure.

To whom do we QSL the HC8X dxpedition for contacts during the CQ-WW?
I remember a K1 on this net who said he was gg to be part of the team.

HS0A was looking for callers Saturday at 1400 GMT on 20 ssb. BY1PK
and BY4AA were both Q5 at 2400 Friday and Saturday. No luck making
a contact. Gee, they always ask the fatal question: "Any more 4's?"

Looks like most of those that wanted my WWVB info got it OK. This past
weekend, I dug into my rcvr and noted that there are some errors in the
drawings. If anyone is going to build it per my drawings, I will furnish

the changes.

I removed my crystal filter and replaced it with a mechanical filter which
has a 6dB bandwidth of about 80Hz. No real difference in performance was noted.
So I would say there is no reason to get fanatic about super minimum bandwidth.

I also threw together a board to decode and display the time code, including
seconds, minutes, hours, and days. The circuit is "discrete" using "LS" type
IC's and has 14 chips not counting the readouts (which include the decoders
and latches). It works OK when the signal is not corrupted by other crap.
However, the minutes display is a minute behind. The literature says that
they send the "anticipated minute" so I would assume it should be correct
at the start of the next minute but looks like this is not so for some reason.

For the past four years I have used a dedicated IC-720A in a mobile
environment and while it's reliability has been excellent, severe
design problems with the noise blanker significantly degrades the
receiver performance under conditions of crowded bands, presence
of moderately strong carriers. The problem is apparently due to
back-biasing if the noise detection diode, related to time constants
which are too long in the presence of strong signals in the wide passband of
first IF. For example, in the presence of strong broadcast carriers on
forty meters, even 500 KHz away, ignition pulses to pass through the
noise blanker almost completely intact.
I am currently looking for another transceiver more suitible for mobile
applications, one with a significantly better-designed noise blanker.
Does anyone have experience with the more recent ICOM's or the Kenwood
line, eg. IC-751, IC-735, 430S ?

"Welcome to McDonald's. May I take your order
please?"

That's what you'll hear if you monitor 154.600 MHz near
Yorkville or Montgomery, Illinois. As my article pos-

ted last April described, McDonalds restaurants in this area have been using radios to communicate with customers at the drive-up windows [see article below].

Although low power transmitters are used, I can monitor the McDonalds restaurant about 2 miles away using a Butternut SC3000 antenna at 20 feet. So far, I can hear only the waitress side of the conversation. The customer side of the conversation may be conducted over a closed circuit intercom.

Articles in the November 1985 issue of "Monitoring Times" claim the McDonalds operation to be nationwide on 154.6 and on 35.02 MHz in Barberton, OH, although the latter frequency has not been confirmed here.

My Uniden cordless phone has recently taken to emitting sporadic
"synthesized cat howls?", kind of whooping noise, which is quite
loud; we've turned off the phone in response. Changing the channel
has no effect. I doubt it is an intermittent in the set, but what
could be transmitting these howls? Any ideas?

When I worked HC8X yesterday in the CQ contest he was giving his QSL
manager as k8cw.

I suspect there are many on the net in addition to n8aat who worked him
as well. It was nice having decent conditions for a change. I forgot
how good 15 meters can be for dx.

Does anyone know the QSL mamager for JG1FVZ/5N25?

Tnx es 73

My pleas of several months back having been completely ignored, I
take terminal in hand to write again. In my first message of this
type, I implored the TVRipOff boys (and girl) to start their own
info-net, to be called surveillance-net or eavesdrop-info, and to
leave that inappropriate trash off of the HAM RADIO NET.

Tonight, I had to delete messages dealing with cordless telephones
being overheard by television sets, AM radios and CIA-home-built
converters. For Pete's sake, that has nothing to do with HAM RADIO!

If you eavesdroppers, peekers and snoopers have any interest in HAM
RADIO, why don't you turn on your rigs and get on the air? If you
have no interest in HAM RADIO, why don't you stop cluttering up the
INFO-HAMS net?

73 to the hams reading this.

To the foregoing should probably be added the topic of packet radio
protocols. Of course, they could conceivably fall in either (or both)
of these categories...

qst de k9eui
hr propagation forecast bulletin nr 43
from arrl headquarters newington ct
october 28 1985
to all radio amateurs bt

since the middle of july the solar flux has been so consistently near the quiet sun level that some observers felt the end of cycle 21 to be imminent. but on october 13 a major new active area came around the east limb of the sun and the solar flux curve turned upward. from 67 the flux rose to 95 by october 22. it was back to 80 by the 27th, but the curve appeared to be flattening out. an active area that produced a slight flux peak on october 3 is returning to view this week. it could keep the flux above minimum levels through november 1 at least.

occasional peaks of solar activity had been expected with cycle

21 still less than nine-and-one-half years old. this one came at the right time of year for maximum effect on the higher dx frequencies. worldwide dx brought a rush of activity back to the 21 mhz band and 24 and 28 mhz pulled back from almost total quiet for a few days at least.

though solar activity is falling again, conditions will be mostly favorable through october 30 at least. higher geomagnetic activity october 31 through november 4 will tend to restrict dx activity to the lower latitudes and transequatorial circuits. best overall conditions for early november should be with us about the 5th to 7th.

american sunspot numbers for october 17 to 23 were between 15 and 53 with a mean of 32.6. ar

October 10, 1985

The ARRL Letter is published bi-weekly by the Information Services Department of the American Radio Relay League, 225 Main St., Newington, CT, 06111; (203) 666-1541. Larry E. Price, W4RA, President; David Sumner, K1ZZ, Executive Vice President; Dave Newkirk, AK7M, Editor; Debra Chapor, Circulation Manager.

Information from The ARRL Letter may be reproduced in whole or part in any form including photoreproduction and electronic databanks, providing credit is given to The ARRL Letter and to the American Radio Relay League.

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds) per year for First-Class Mailing to the U.S., Canada, and Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

o ARRL FILES COMMENTS ON PR 85-22

o ANOTHER HAM IN SPACE

o ...and much more!

PERIMETER PROTECTION SYSTEMS ON 6 METERS?

In turning a Canadian company's petition for operation of a perimeter protection system into a Notice of Proposed Rulemaking, FCC appears to have deflected a potential threat to the Amateur Radio Service at 50-54 MHz. In the NPRM, General Docket 85-231, FCC responded to a request for a waiver of Part 15 at 50-88 MHz by proposing 54-88 MHz instead.

It all began with a bit of alphabet soup called "CTLFDS" and ended up "GUIDAR." "CTLFDS" stands for "coupled transmission line field disturbance sensor." Control Data Canada, Ltd. (CDC), developed one and called it GUIDAR. It's a system that can be used to provide security surveillance for prisons, and to protect high-risk sites such as nuclear power stations from terrorism, theft and vandalism. GUIDAR operates on a principle of guided radar whereby a detection zone is created between "leaky" or ported coaxial cables deployed around the protected area. The present GUIDAR system employs two parallel cables buried approximately five feet apart and nine inches below the ground.

An RF pulse is transmitted into one cable; some of this energy is coupled via the ports (holes) in the outer conductor of this cable into the ground and air near the cable. Some of this energy is reflected by objects in the ground and discontinuities in the soil, and is coupled into the second, or receiving, cable. When a human or other large object crosses between the cables, the change in RF coupled from cable to cable is detected and triggers an alarm. Such systems may cover a perimeter up to 2 miles long.

On June 24, 1984, CDC asked FCC for a waiver of Part 15 of its rules to allow the operation of GUIDAR at 50-88 MHz. (Part 15 is that part of the FCC Rules governing operation of unlicensed low-power communication devices. Familiar Part 15 devices include cordless telephones, 49 MHz walkie-talkies, garage-door openers, etc. Such devices must not interfere with any other service; they must tolerate interference from other services.)

Why did CDC make a run at 50-88 MHz? The aim was improved performance of its GUIDAR. CDC indicated that the ability of the system to detect actual intrusions and to ignore objects that could cause false alarms is affected by the frequency of operation. Below 30 MHz, sensitivity of the system to humans drops dramatically. Operation above 100 MHz increases the system's sensitivity to small animals, resulting in numerous false alarms; also, above 100 MHz, signal loss in the cable is significant. CDC stated that such systems must operate somewhere between 30 and 100 MHz.

CDC stated that the present rules in Part 15, Subpart F, allowing perimeter protection systems to operate in the range 40.66 to 40.70 MHz, do not allow for effective operation of a system such as GUIDAR. GUIDAR uses a pulsed signal with a bandwidth of 2.5 MHz. A pulsed signal is employed to allow determination of the exact location along a perimeter where intrusion has occurred.

CDC proposed 50-88 MHz for GUIDAR. This range includes the amateur 6-meter band, TV channels 2-6 and radio astronomy and avigation at 72-76 MHz. CDC contends that its perimeter protection systems can operate in the 50-88 MHz range without causing interference to radio services on those frequencies.

In the NPRM, FCC said that CDC's reasons for selecting 50-88 MHz, rather than 30-50 or 88-100 MHz, were "unclear." Yet, "In view of the public benefits to be derived from improved security at facilities such as prisons and nuclear plants, we find it appropriate to accommodate such systems to the extent possible." Operation of CTLFDS on vacant VHF TV channels sits well with the Commission. But what about 6 meters? Said FCC, "We have reservations about also permitting these systems to operate in the 50-54 MHz amateur radio band because these systems could

extend for considerable distance around a large facility, thereby increasing the likelihood that an amateur transmitter could come in close proximity to some part of the system."

What has been proposed by the Commission is a set of standards for perimeter protection systems allowing for operating at 40.68 MHz, 54-72 MHz and 76-88 MHz. For systems operating between 54 and 88 MHz, strength of emissions is not to exceed 10 microvolts per meter at a distance of 30 meters -- the same limitation placed on computers for use in residential areas. FCC carved 50-54 MHz and 72-76 MHz from CDC's original proposal: "Permitting operation on TV channels 2 through 6 should be more than sufficient, since this ensures that in any given area there will be at least two vacant TV channels on which a perimeter protection system could be set to operate."

Comments on General Docket 85-231 were due by October 11, 1985, with the League to file in support of FCC's decision to keep these devices out of the 6-meter band. Reply Comments are due on or before November 12.

FCC PREPARES TO NAIL RADIO PIRATES

The Federal Communications Comission's monitoring network is continuing to investigate and fine illegal radio operators on a number of frequencies. Through long-distance direction finding, unlicensed "pirate" radio operations have been identified near these cities: Richmond, Charlottesville and Staunton, VA; Youngstown, OH; Miami and Orlando, FL; Minneapolis, MN; Washington, DC; Louisville, KY; Waterbury, CT; Newark, DE; Grand Rapids and Lansing, MI; San Francisco, CA; Arkansas City, KS, and Fort Smith, AR.

The operation of unlicensed radio stations is in direct violation of FCC Rules and Regulations. Their operation may endanger life and property by causing harmful interference to licensed radio operations.

One such pirate station, "KRZY" of Arkansas, was located and inspected on March 9, 1985. As a result of the inspection, a $1000 Notice of Apparent Liability was issued for unlicensed and out-of-band operation. The same operator soon returned to the air, and on August 9, 1985, U.S. Marshals, accompanied by an agent from the FCC District Office in Dallas, served a warrant and seized transmitting equipment
used by the radio operator. The search and seizure resulted from a close-in DF to his residence on August 16, 1985, at which time the station was identifying itself as "KBBR" on 7440 kHz.

If convincted of operating an unlicensed radio station, the operator faces a maximum penalty of one year imprisonment, a fine up to $10,000 and a possible forfeiture of radio equipment to the U.S. government.

Persons having information that would assist the FCC in its effort to locate and close down pirate radio stations should contact: Engineer in Charge, FCC, P.O. Box 1588, Grand Island, NE 68802-1588; telephone (308) 382-4296.

NEW ADDRESSES FOR TWO FCC OFFICES

FCC's Anchorage District Office has moved to 6721 West Raspberry Road, Anchorage, AK 99502, telephone (907) 243-2153. The Honolulu Office has moved shop as well; their address is Waipio Access Road, Next to the Ted Makalena Golf Course, P.O. Box 1030, Waipahu, HI 96797. The telephone there is (808) 677-3318.

Both offices are open from 8 A.M. to 4:30 P.M. Public inquiries concerning telecommunications matters, complaints of electronic interference and schedules of commercial radio operator examinations should be directed to these addresses.

THAT THIRTY-DAY RULE ISN'T GONE YET

From the ARRL/VEC office comes this reminder for all ARRL-accredited Volunteer examiners: don't forget that the thirty-day wait rule remains in force until November 8. Don't risk your license by breaking the rule while it is still on the books. After November 8, each VEC entity may set its own waiting period. Once the ARRL Board has determined the cost impact of this rules change, ARRL/VEC VEs will be advised as to what the ARRL/VEC retest policy will be.

COHERENT CW ON LONGWAVE

Have you heard of the 1750-meter band? It spans 160-190 kHz, and U.S. experimenters there are allowed unlicensed operation with no more than 1 watt DC input and a 15-meter antenna. (Don't get out your calculators; that's like having QSOs on 80 meters with a wire just a hair longer than two feet!) It is possible to make electromagnetic hay on 1750, though -- especially if you jump into the experimental spirit of the band and its users. More and more 1750-meter experimenters, or LOWfers, as they're nicknamed, are turning to uncommon technologies in their quest to span greater distances on the band. One such technology is coherent CW (CCW). What's coherent CW? There's quite a bit on the technique on pages 21-9 to 21-12 of the The ARRL 1985 Handbook for the Radio Amateur. Simplistically put, it's a method wherein transmit and receive frequencies, keying speed, and receiver bandwidth are synchronized, allowing something like a 20dB improvement in signal-to-noise ratio at 12 WPM over non-coherent CW systems at similar signalling rates. From the September issue of QEX, the ARRL Experimenter's Exchange, comes this report on 160-190 kHz CCW:

"Mike Mideke, WB6EER, and I have been experimenting with coherent CW in the 1750-meter experimental band. My CCW beacon is located in Morro Bay, California, transmitting 10-baud CCW, while Mike is receiving with a Petit PCF-3 coherent CW filter (QST, May 1981). A digital dot is precisely 0.1 second, while dashes, space and blanks between elements are 0.3 second long. A 32-bit memory is used, making the entire ID 10.7 seconds. All experiments have been conducted on 176 kHz, as sufficient RF stability occurs with ordinary crystal control. 166.66667 kHz was planned, but carrier accuracy is far less stringent than first thought!

"Phase-locking to 10-MHz WWV was discarded after the discovery that 100-kHz LORAN C signals were received while tranmitting on the same antenna, using a simple 100-kHz tuned circuit. A basic 100-kHz receiver is now needed with only a sample and hold output such that a phase lock can be achieved with a 1-MHz crystal. A commercial LORAN C unit was used for this initial try.

"It is becoming more apparent that stabilities and complexities first thought necessary are not required when the communication experiment lasts for a few hours, or can be optimized by the operator on the spot. Both Mike and I are now look-ing for an experimenter in, say, the Hawaiian islands, to show what coherent CW and one watt of power can really do" -- Cliff Buttschardt, W6HDO, 950 Pacific St., Morro Bay CA 93442.

ARRL FILES COMMENTS IN PR DOCKET 85-22

In response to rising interference in the repeater subbands, FCC released a Notice of Proposed Rulemaking on repeater coordination, PR Docket 85-22, in January of this year. FCC intends to add to Part 97 the definitions of "coordinated repeater," "harmful interference" and "frequency coordinator" -- and a new paragraph (h) to Section 97.85 reading, in part, that "where one repeater is coordinated and the other is not the station with the non-coordinated repeater has primary responsibility to resolve the interference." This was really bringing the question of whether or not one should coordinate one's machine home to roost! Further, the NPRM included a moratorium on new repeater operation in some large metropolitan areas; this moratorium was lifted in February as a result of a Request for Partial Reconsideration filed at near-light speed by the League. Another aspect of the moratorium had quickened pulses in the field when the fine print of 85-22 was read as defining "new" repeaters as those that would not be listed in the new edition of the ARRL Repeater Directory -- unless other proof of pre-operation was available. The result was a scramble to list repeaters in the Directory just as the book was in its final editing stage. The original deadline for the filing of comments had been July 1, but this was extended at ARRL request to August

15, 1985: the League's Board of Directors wished that maximum time be allowed for it to consider input from those concerned. And "those concerned" were legion.

The gist of the League's August 15 filing in Docket 85-22 was succinctly put at Minute 74 of the Board's July meeting in Hartford (see September 1985 QST, page 57):

1) Preferred status in instances of harmful repeater-to-repeater interference should be granted to amateur repeater operators who have implemented the recommendation of their local or regional frequency coordinator and are thereby coordinated.

2) Frequency coordination should be strongly urged for all amateur stations in repeater or auxiliary operation in any geographical area that is served by a frequency coordinator.

3) The FCC should not consider alternatives to frequency coordination nor mandate methods of coordination.

4) The use of modern technological innovations, such as those cited in the NPRM, should be encouraged, but not substituted for frequency coordination.

5) The FCC should not recognize a single entity, such as a National Frequency Coordinator, for amateur repeater operation. Such coordination activities should be performed by local or regional frequency coordinators with appropriate support to these coordinators to be provided by the ARRL.

6) The ARRL also recommends that the scope of frequency coordination include all Amateur Radio stations in repeater or auxiliary operation.

7) The ARRL further recommends that consideration of the procedural framework within which frequency coordinators are recognized and conduct their operations be subject to a future FCC proceeding.

Next on the agenda: reply comments, which were due by September 30. More on the League's filing in November QST; watch there, and here, for more on lively 85-22.

It's almost November 1 -- that's the deadline to register your repeater with Hq. for the 1986-87 Repeater Directory. Hint...

AMERICANS ON THE AIR IN JAPAN

Nineteen days after the U.S.-Japan reciprocal operating agreement took effect, September 26 saw five individual-station licenses issued to U.S. amateurs, effective October 1: 7J1AAA was issued to AH0/A, 7J1AAB to NA2Y, 7J1AAC to KH2AC, 7J1AAD to

WA4PRF, and 7J1AAE to AI0/D. Full information for operating in Japan under the new arrangement is available from ARRL Headquarters.

ANOTHER HAM IN SPACE IN 1986

NASA has announced that Ron Parise, WA4SIR, is scheduled to be a member of the crew for the Astro 1 shuttle mission, 61E, in March 1986. Astro 1 is the first of three related astronomy missions. Ron is an active AMSAT member, and there is a possibility of Amateur Radio operation from the shuttle once again being approved by NASA.

"I GUESS YOU HAD TO BE THERE..."

The best-told jokes sometimes elicit that response . . . usually after an ego-crushing pause. But it also applies to HF propagation. Sure, we're in the depths of a solar minimum, but there's good use to be made of the HF bands yet -- if you're there when the band opens, making your presence known. And this is equally important at VHF/UHF. W1HDQ put it well in a recent W1AW propagation forecast: "We are moving into the best months of the year, but activity is the key. Nobody ever worked DX with a receiver."

AMATEUR RADIO, NEWSGATHERING AND BROADCASTING

"The Commission's Rules generally permit rebroadcasts of transmissions of stations in non-broadcast radio services, but prohibit the use of stations in services not allocated for broadcast purposes to transmit communications intended for broadcasting."

Such was one of the many comments read out by FCC in last June's Report and Order terminating the proceeding in BC Docket 79-47. It seems straightforward enough. The heading for 79-47 reads "In the Matter of Amendment of Parts 73 and 97 of the Commission's Rules Concerning Rebroadcasts of Transmissions of Non-Broadcast Radio Stations"; the intent of the proceeding was to clarify what use could be made of non-broadcast radio by broadcast users of radio (and television!). Has it?

Some say yes and some say no. FCC was pretty sure it had covered all the bases. In the text accompanying the rules changes ordered in 79-47, FCC touched upon broadcasting, Amateur Radio, General Mobile and CB interests. The Commission related how it had dealt with a request from the National Association of Broadcasters for the amendment of the rules to permit broadcast stations to rebroadcast CB emergency transmissions and to permit amateur stations to transmit emergency and public safety information for broadcast and broadcast-related purposes. Congress had modified Section 605 of the Communications Act of

1934 to eliminate the statutory proscriptions on the unauthorized interception of Amateur Radio and CB transmissions. Another modification of 605 in October 1984 did nothing to alter matters relating to privacy or rebroadcasts of Amateur Radio and CB communications. FCC had decided to undertake "a comprehensive review and revision of its regulations with respect to rebroadcasts of transmissions of non-broadcast radio stations." Another log on the fire was the interaction between the broadcast media and Amateur Radio when the U.S. invaded Grenada in October, 1983. What about cooperation between Amateur Radio and the National Weather Service -- the collection of weather data, the spotting of tornadoes and their associated severe storm systems? It all had to be dealt with comprehensively in BC Docket 79-47. The outcome was the 18-page document released by FCC on June 13, 1985. The Report and Order revised several sections of Part 97, the Rules for the Amateur Radio Services; these revisions were covered briefly in August 1985 QST's Happenings, and in greater detail in Washington Mailbox, September QST. The full text of these revisions follows this piece.

Glossed, the revisions to Part 97 redefine "emergency communications," add a prohibition of broadcasting to the rules pertaining to repeater operation, and slightly alter the text of the rule prohibiting business communications. There is great expansion on the theme of Section 97.113 ("Broadcasting and broadcast-related activities prohibited"): what was a two-sentence paragraph was revised to detail in nine paragraphs the dividing line between Amateur Radio and broadcast work. In paragraph 20 of the discussion accompanying these revisions, the Commission says that "we are revising the amateur rules and including specific provisions to prohibit use of amateur stations for broadcast news gathering or production purposes as proposed. These rules will prohibit use of an amateur radio station as a remote pickup or auxiliary link broadcast service facility. Such uses of an Amateur Radio station as forwarding weather reports or providing commuter traffic reports for use in any broadcast context will continue to be expressly prohibited." That seemed to nail things down pretty well.

Some customers weren't satisfied -- ARRL, for one. The League took exception to the narrowing of the definition of "emergency communication" as set forth by the Report and Order (see "Petition for Reconsideration," below). The original Notice of Proposed Rulemaking in 79-47 hadn't proposed such a revision, and the original definition was adequate. Inconsistencies between the letter of the Part 97 revisions and the preceding comments by FCC might require "snap judgments" on the part of amateur operators as to the legality of a given communication.

The National Association of Broadcasters (NAB) and the Radio-Television News Directors Association (RTNDA) were similarly concerned with discrepancies between the revised amateur rules and FCC comment. "The Commission should permit

amateur radio operators to cooperate with broadcast journalists to gather and report news during broadly defined emergency situa tions . . . the danger is that the black-letter rules . . . can be read narrowly as restricting significantly the ability of broadcasters and amateur radio operators to provide information of vital interest to the public during periods when such information cannot be transmitted in a timely fashion by other means of communication."

The National Weather Service wasn't satisfied. Interpretations of the revised Part 97 in the 79-47 Report and Order from some sources in the Amateur Radio media had participation in severe weather spotting nets drying up. Couldn't Amateur Radio relay reports of threatening weather to NWS, or did it have to wait for actual tornadoes to drive actual straws through actual fence posts (or houses, or people) before reacting to an "emergency"? Could Amateur Radio report on a cracked dam that hadn't broken?

The cracked dam broke, so to speak, on September 19, 1985, when the first of several terrific earthquakes struck Mexico. Print and electronic news media descended on ham shacks in force. There was raw newsgathering in the ham bands. Perhaps worse, amateur frequencies were used for the passing of business traffic many observers say went beyond what was called for by the earthquake emergency. What, in the language of the final Report and Order in BC Docket 79-47, could have allowed this?

It will go down in amateur history as "the rule of reason." The black-and-white revisions of Part 97 in the Order prohibit newsgathering right enough. But there was something else -- something ARRL had questioned in its July Petition for Partial Reconsideration. It had raised eyebrows at NAB and RTNDA as well. In paragraph 22 of the discussion preceding those revisions in the Order, FCC had opined:

"We note that a rule of reason applies when interpreting this emergency exception to the broadcast prohibitions in the Amateur Radio Service. Thus, conveying news information directly relating to an unforeseen event which involves the safety of human life or the immediate protection of property falls within this rule of reason, if it cannot be transmitted by any means other than amateur radio because of the remote location of the originating transmission or because normal communications have been disrupted by earthquake, fire, flood, tornado, hurricane, severe storm or national emergency . . ."

Boom. There it is. That was the loophole. That's what was behind the newsgathering and questionable business traffic you may have heard on amateur frequencies during the Mexican earthquake disaster. The clinker is that the letter of the rules prohibited much of what went on, no matter what related opinion in the 79-47 document had to say. Informal comment from FCC

subsequent to all this has indicated that such use of amateur frequencies wasn't what they'd had in mind at all! But informal comment is just that: non-binding, unofficial. And what of the National Weather Service's plaint: shrinking participation in spotting and reportage of tornadoes, hurricanes and other severe weather on the part of radio amateurs who wish to continue their tradition of serving the public interest the best they know how -- while sticking to the rules? Official clarification on a number of points in Docket 79-47 may be in order.

To update your copy of The FCC Rule Book, revise paragraph (d) of Section 97.3 (Definitions) to read as follows:

(w) Emergency communication. A non-directed request for help or a distress signal directly relating to the immediate safety of human life or the immediate protection of property.

Paragraph (d) of Section 97.85 (Repeater operation) is revised to read as follows:

(d) A station in repeater operation shall be operated in a manner ensuring that it is not used for broadcasting (see Section 97.113).

Section 97.91 (One-way communications) is removed and reserved.

Section 97.110 (Business communications prohibited) is revised to read as follows:

The transmission of business communications by an amateur radio station is prohibited except for emergency communications (see Section 97.3[w]).

Section 97.113 (Broadcasting prohibited) is revised to read as follows:

Section 97.113 Broadcasting and broadcast related activities prohibited.

(a) An amateur station shall not be used to engage in any form of broadcasting, that is, the dissemination of radio communications intended to be received by the public directly or by intermediary relay stations.

(b) An amateur station may not be used for any activity directly related to program production or news gathering for broadcast purposes.

(c) An amateur station shall not retransmit programs or signals emanating from any class of radio station other than amateur, except for emergency communications (see Section 97.3[w]).

(d) The following one-way amateur transmissions are not considered broadcasting:

(1) Beacon or radio control operation;

(2) Information bulletins consisting solely of subject matter relating to amateur radio;

(3) Transmissions intended for persons learning or improving proficiency in the international Morse code; and

(4) Emergency communications (see Section 97.3[w]).

(e) Round table discussions or net operations where more than two amateur stations are in communication with one another are not considered broadcasting.

ARRL WOULD LIKE THE EVIDENCE

The cooperative emergency communications work between amateurs, "served agencies" and the media which occurred following the Mexican earthquakes in September was generally outstanding, an excellent example of service in the public interest, convenience or necessity. At the same time, there were some instances in which media personnel stretched the "Rule of Reason" to the breaking point by using Amateur Radio for business rather than communications. In order to reduce the chances of abuse next time there is a widespread disaster, League Hq. would appreciate receiving (in the next week or two) tapes or other firm evidence of misuse by the media which can be used in a low-key way to correct the problem.

ARRL COMES DOWN HARD ON ATTEMPT TO USE AMATEUR FREQUENCIES FOR BROADCAST PURPOSES

What's new under the sun? The proverbial rejoinder might be that there's nothing new except what's been forgotten. Let's take a peek into the 1933 edition of The Radio Amateur's Handbook:

"...A hotel on the Pacific Coast offered an amateur radio club a fine meeting place with free light, power and heat -- provided the amateurs would establish an amateur station and relay messages for guests of the hotel. A certain newspaper planned to 'organize an amateur radio club' and establish a 'net' for the collecting of amateur news for the paper. It offered the amateurs a club room and the facilities of a powerful station that it would install as 'net control station' in return for the things it could gain by making amateurs violate their amateur status!"

What's new? It's been called PRB-2. On August 13, 1985, Lee Shoblom, N6ADA, President and General Manager of London

Bridge Broadcasting, Inc., filed a request for waiver of the amateur rules to permit him to use Amateur Radio in newsgathering for broadcast purposes. He requested that he be able to use 434 MHz for gathering news of community interest for broadcast on his low-power television station. Hmmm. Wasn't this just a fancy way of proposing the use of Amateur Radio in "remotes" (remote pickups) for "electronic news gathering" (ENG)?

ARRL thought so. One of the decisions taken at the August meeting of the ARRL Board's Executive Committee was that Counsel be ordered to file comments opposing "in the strongest possible terms" the unwarranted intrusion of broadcasting into an amateur band. Here are some of those comments:

"The League is frankly at a loss to understand how this request merits establishment of a pleading cycle for public comment. Even had London Bridge attempted to meet its burden to justify a waiver, the issue raised therein -- use of Amateur Radio for broadcast purposes -- has just been addressed directly in a full notice and comment proceeding. Report and Order, Docket 79-47 [see above - editor] . . . the solicitation of comment has caused a great deal of misunderstanding on the part of responsible broadcasters and amateurs. It has further confused the process of determining the reasonable parameters of cooperation in emergencies between the two types of licensees. The pleading cycle should be terminated immediately and the waiver request denied.

"When an applicant seeks waiver of a rule it must plead with particularity the facts and circumstances which warrant such action and give affirmative reasons to justify the grant of the waiver and the public interest . . . London Bridge has not even attempted to meet this burden. The sole justification stated in the request is that:

`I'm well aware that this is a most unusual request, but I feel it is right in line with the many recently lifted FCC restrictions, amateur and commercial, allowing better service to the community, more efficiency in our operations and a more reasonable approach to rules and regulations.'

"Such a general hearts-and-flowers approach fails utterly to justify a waiver of whatever Amateur Radio Service Rules London Bridge wishes to have waived. The request is procedurally inadequate and must be denied.

" . . . London Bridge's request . . . apparently seeks waiver of both Sections 97.110 and 97.113 of the Rules, which prohibit . . . business communications (except emergency communications) and broadcast-related activities. Specifically, Section 97.113(b) of the Rules directly prohibits use of an amateur station 'for any activity related to program production or news gathering for broadcast purposes.' This is, of course, exactly what London Bridge wishes to do with amateur station K6ADA.

" . . . The broadcast services are adequately served by remote pickup broadcast service facilities for remote transmissions of the type sought by London Bridge . . . it is obvious that the basis for London Bridge's request is that amateur television equipment is significantly less expensive than type-accepted broadcast remote-pickup transmitters and associated equipment and is of high enough video quality to be used for TV auxiliary use . . . London Bridge more appropriately should have sought a waiver of type-acceptance requirements for TV auxiliary stations under Part 74 to allow use of non-type-accepted hardware on broadcast auxiliary frequencies . . .

"Commercial use of Amateur Radio is antithetical to the basis and purpose of the Service, as understood both nationally and internationally. Use of amateur frequencies for newsgathering and other broadcast-related purposes is expressly prohibited by the Rules, and has uniformly been so prohibited since the advent of the Service . . . the instant waiver request is a blatant intrusion into the non-commercial nature of Amateur Radio with no explanation even attempted. With vast spectrum allocations available to TV auxiliary use in the area of Lake Havasu City, the absurdity of the request is apparent."

Reply Comments in PRB-2 were to have been filed by October 28. It's hoped that FCC's answer to the London Bridge request will be succinct. The same old question deserves the same old answer: broadcast use of amateur frequencies is not Amateur Radio. But that's nothing new.

ARRL'S PETITION FOR PARTIAL RECONSIDERATION
IN BC DOCKET 79-47

As mentioned above, ARRL has asked for partial reconsideration in 79-47. Here are some of the finer points:

1) As noted above, prior to the effective date of its Report and Order, Section 97.3(w) of the Rules defined emergency communications as "any amateur communication directly relating to the immediate safety of life of individuals or the immediate protection of property" This definition has adequately served to inform amateurs of what constitutes emergency communications and what does not, from the point of view of exceptions to the prohibitions of one-way communications and of business communications.

2) The original Notice of Proposed Rulemaking in 79-47 did not suggest revision of the definition of emergency communications. It did propose the elimination of the authority to transmit one-way "emergency communications including bona fide emergency drill practice transmissions" address to amateur stations. The League's comments objected to the deletion of express authority to engage in one-way emergency communications and to make such transmissions in bona fide simulated emergency preparedness tests in which amateurs are

engaged routinely.

3) No good reason can be found to justify the extremely narrow and restrictive definition of emergency communications cast upon the Amateur Service for the first time in the Report and Order in 79-47.

4) The "rule of reason" noted in the Report and Order is no substitute in this instance for a rule which is sufficiently broad on its face to allow amateurs the flexibility to exercise their own demonstrated reasonableness in emergency communications situations. Licensees should not have to make snap decisions on the legality of a communication under emergency conditions; the rule itself should provide sufficient flexibility.

5) The old definition of "emergency communications," or one less restrictive than the former, should be adopted.

421-430 MHZ GOES TO LAND MOBILE

Effective November 4, 1985, FCC has allocated portions of the band 421 to 430 MHz to the Land Mobile Service in the vicinities of Detroit, Cleveland and Buffalo. This has been undertaken to reduce Land Mobile channel congestion near these cities. Because 420 to 430 MHz was removed from the Amateur Service North of Line A as of September 28, the use of 421-430 MHz by Land Mobile operations is expected to have minimal impact on amateur use of the 70 cm band. Amateurs south of Line A, but within interference range of these cities, must avoid interfering with the primary Land Mobile Service.

THIRD PARTY TRAFFIC OK WITH U.K.

The Federal Communications Commission announced an agreement, effective October 14, with the United Kingdom's Department of Trade and Industry, permitting third-party communications between amateurs in the United States and special events stations in the U.K. This applies only to U.K. special event stations using the prefix GB, but note that GB3 stations are excluded. Three conditions apply: 1) Communications are limited to conversations or message of a technical or personal nature too unimportant for a commercial message. 2) No compensation, either direct or indirect, may be received for the passing of such traffic. 3) Communications must accord with regulations for amateurs in each country.

REPEATER COORDINATION AND HAMS IN SPACE AT THE ARRL NATIONAL CONVENTION IN LOUISVILLE

4000 radio amateurs attended the ARRL National Convention in Louisville, Kentucky, over October 4-6 -- were you there? Some of the highlights:

Astronaut Tony England, W0/ORE, presented the ARRL with a black-and-gold ARRL pennant and Spacelab 2 mission patch -- both items may have been available terrestrially, but this particular pair were flown aboard the Space Shuttle Challenger during Mission STS 51-F. Accepting these high-flying mementos for ARRL was Executive Vice President Dave Sumner, K1ZZ. They're inscribed: "In appreciation of your efforts in the Shuttle Amateur Radio Experiment (SAREX) flown aboard the Space Shuttle Mission 51-F."

Repeater coordinators conducted a meeting to report on progress since their Dayton meeting. This productive session was under the aegis of the Ohio and Michigan Area Repeater Councils. Co-chairing were John Hackman, WB4VVA, of Michigan, and George Waldie, W8JRL, of Ohio. Steve Mendelsohn, WA2DHF, ARRL Hudson Division Vice Director, reported on the first issues of the Repeater Coordinators' Newsletter, of which he is the editor. The RCN helps keep coordinating lines of communication open, and has been well received. Concerning a national repeater database, WB4VVA enumerated the requirements for such, which include (1) allowing each coordinator to update his or her file only; (2) allowing anyone to read the file; (3) that the system be "stand-alone" with WATS line accessibility; and (4) that there be adequate backup. WA2DHF reported on the progress of ARRL's study of the provision of such a database. There was some difference of opinion as to whether such a system would be under the "control" of Hq. or the coordinators.

Concerning coordinated vs. uncoordinated repeaters, how do you recognize a legitmate coordinator when you see one? FCC must be able to identify them. Ray Kowalski of the Commission indicated that, in his opinion, FCC would accept a regional coordinating body to certify individual coordinators under its geographical jurisdiction. In cases of conflict, the consensus of those assembled was that the League should play a role in "unmasking" who are the "real" coordinators. This could be done through the League directors in the affected areas.

PIRATE BROADCASTERS FINED

As related in the last Letter, FCC has been drawing the net tighter around unlicensed broadcasters. Here's more on those activities. On August 19, 1985, U.S. Marshals, accompanied by an investigator from the Dallas District Office of the FCC, served a warrant and seized radio transmitting equipment utilized by Russell E. Rierson of Boonesville, Arkansas. Rierson had been operating an unlicensed "pirate" radio station on various frequencies in the 6 MHz shortwave broadcast band and the vicinity of the 7 MHz amateur band. Close-in direction-finding by FCC personnel from the Dallas Office revealed that the station, located at Rierson's residence, was operated on August 16, 1985, using a frequency of 7440 kHz and identifying as "KBBR."

Investigators from the Dallas Office had previously located Rierson's unlicensed station, then identified as "KRZY" and "Captain Crazy," on March 9, 1985. Those illegal operations resulted in Rierson's payment of a $1,000 administrative fine.

In another case, an investigator from FCC's Kansas City District Office located an unlicensed broadcast station operated by Liam P. Ryan in Kirkwood, Missouri (a suburb of St. Louis). Mr. Ryan's unlicensed broadcast activity was terminated on August 9, 1985, just one week after his operation was first detected by the FCC monitoring network. Mr. Ryan was operating on a frequency in the 7 MHz region. The Kansas City Office has issued a $1,000 Notice of Apparent Liability to Ryan for his unlicensed operation.

Operation of an unlicensed broadcast station is a serious matter. Persons operating an unlicensed broadcast station are subject to administrative fines or prosecution in U.S. District Court. And unlicensed broadcast operation by holders of other types of FCC licenses may result in the loss of those licenses for those concerned.

WATCH THAT FORM 610 AFTER JANUARY 1

On October 17, FCC released a Public Notice alerting Amateur Radio Service applicants that editions of Form 610 prior to that of June 1984 would no longer be acceptable for filing Effective January l, 1986, only the June 1984 and later editions of FCC Form 610 may be used to obtain an Amateur license. Applying on earlier editions of the form after January 1 will delay issuance of your license: your application will be returned without action and you will be required to refile on a current form.

MORE PRIVILEGES FOR CANADIAN AMATEURS

Canada's Department of Communications had good news for Canadian amateurs at the Radio Society of Ontario's convention in London, Ontario, at the end of September. Effective Friday, September 27, Canadian amateurs were allowed CW and phone at the maximum legal power on the entire 160-meter band, 1.8-2 MHz. Repeater use at 10 meters was authorized. And for video experimenters came the news that amateur television with a 6-MHz bandwidth was authorized -- and slow-scan television operation no longer requires a special endorsement. Congrats! DOC declined to comment on the restructuring of the Amateur Service, which is likely to propose a Canadian novice license. DOC did indicate its intention to proceed with the proposal for deregulation of mode subbands, which would allow Canadian amateurs to operate any mode anywhere in their amateur allocations, relying only on voluntary adherence to recommended band plans.

MORE ON EUROHAMS IN SPACE

The September 12 Letter detailed more upcoming Amateur Radio from Spacelab -- DP0/SL, to be operated by German science astronauts DG2KM and DD6CF. But liftoff time and date weren't known then. Radio Netherlands' "Media Network" carried the news just before our presstime that the launch was set for Wednesday, October 30, at around 1700Z. The shuttle is now reported as being Challenger, not Columbia. "For the first time, mission control of the payload will be carried out in Europe at the German operations control center near Munich, instead of from the Johnson Space Center in Houston." Monitor W1AW for further details.

SECURITY

Finally, once again from "Media Network," this comment on data security. Seems a group of Dutch "under 19's" were on a computing field trip to England. During a visit to a Royal Air Force base, they were given official permission to take a crack at the base computer. Could they hack their way in? Yeah. Took seven minutes.

Bear with me as I pour my thoughts out to the terminal...
(I thought that this might be of interest to amateurs in general, thus the posting to net.ham-radio.)

> I have had a desire to do a user interface for a computer controlled receiver for some time now, and now that I have both a computer controlled receiver and a computer to control it I would like to start planning how this thing will work. I have had a few

sessions with paper and pencil trying to brainstorm features, but have run out of ideas. Anybody have any suggestions? Here are a few of the better ones I have thought of...

1. extensive logging features, i.e. one key, printer, log book styles

2. external hardware support. While I cannot know what will be installed, I can always allow for external compilation and installation of device drivers. Allowing for extra displays and functions will be a design requirement. For example, my receiver has a relative signal level output, but is analog. I plan to serialize this data and bring it in the serial port continuously, ignoring data overruns, and average it for the squelch and S-meter functions.

3. database-style memories. This means a relational database to store and retrieve frequencies as well as to generate lists of frequencies for scanning. An example of its use would be:

```
xtmp = select FREQ in AMATEURS
```

xtmp now contains a list of all the frequencies in the AMATEURS database. Scanning could proceed by stating:

```
scan (xtmp)
```

or perhaps you would like to limit the search:

```
friends = select FREQ outof xtmp where (CITY=="local")
```

then

```
scan (select FREQ outof friends where (TYPE=="repeater"))
```

as you can see this could be powerful, especially augmented with a hard-disk full of national frequency lists, and a pointer-oriented user interface. These features may be done using an existing package (RBASE & MS Windows).

4. script files for running the system in a "BATCH" mode.

5. duplex mode -- transmission ends on one frequency, and reply is on another. Computer control could follow this very well given a digitized signal level reading.

...

Please reply to me *directly* and I will summarize to the net and to each individual that asks.

BTW, does anything similar exist?

Worked a couple of new ones on QRP during CQ WW DX contest this last
weekend, and would like QSL manager info (if any) for:

        VP2MW   TI2CF

Any help? Tnx--

Jim Price, K6ZH, PRICE@NOSC.ARPA

P.S. Can we order band conditions like last weekend for CQ WW Phone,
too, please?

Part of the problem is postings from the usenet side, I imagine.
A lot of news reading software posts messages to all groups included
in the original message, which actually may have had some relevance
to amateur radio issues (and therefore info-hams and net.ham-radio)

There was a net.tvro for a while, but it went away. Perhaps a new group
(say, called mod.telecom.home-sat) could be created for tvro users
If there is too much tvro traffic for this group, and we complain enough
about it (to the right people), then there may be some relief.
Accoring the the usenet 'rules', one criterion for creating
a new group is sufficient volume in a current newsgroup to
justify spinning it off into a separate one.

This list has not been updated for some time. If there are any errors or suggestions, please let me know. I take no responsibility for errors!

Changes reflected in this issue include new modes on 160 meters and the opening of the 12 meter band.

The "Considerate Operators Frequency Guide"
(Frequencies generally recognized for certain activities)

1800 - 1825	cw only	14.08 - 14.10	RTTY
1825 - 1830	dx window	14.23	SSTV
1850 - 1855	dx window	21.09 - 21.10	RTTY
3610 - 3630	RTTY	21.34	SSTV
		24.92 - 24.93	RTTY
3637.5	AMTOR	28.09 - 28.10	RTTY
3845	SSTV	28.68	SSTV
7090 - 7100	RTTY	29.30 - 29.50	SATELLITES
7171	SSTV	29.52 - 29.58	RPTR inputs
10.14-10.15	RTTY	29.60	FM simplex
14.075	AMTOR	29.62 - 29.68	RPTR outputs

DIGITAL COMMUNICATIONS: (F1, 3.5-28 MHz)(A2, F1, F2 above 28 MHz)

BAUDOT: (International Alphabet #2)
A2, F1, F2: Maximum frequency shift = 1000 Hz.
A2, F2: Highest modulating frequency = 3000 Hz.
Maximum speed = 100 wpm (75 baud).

ASCII: Maximum baud rates:
3.5 - 28 MHz = 300 baud
28 - 50 MHz = 1200 baud
50 - 220 MHz = 19600 baud
220 - up = 56000 baud

AMTOR: TOR specifications are found in CCIR Rec. 476-2.
(100 baud, Block rep rate 2.222/sec.)

NOTE: Above 50 Mhz, the frequency shift in Hz shall not exceed the sending speed, in baud, or 1000 Hz, whichever is greater.

OTHER DIGITAL CODES: (ABOVE 50 MHZ ONLY):
Any other digital code may be used above 50 MHz in the domestic U.S. (Except where A1 only is permitted). A description of the code and modulation technique must be kept in the log.

Bandwidth limitations:
50 - 220 MHz = 20 kHz max.
220 - 1215 MHz = 100 kHz max.
1215 and up = any Bw if in accordance with

97.63(b) and 97.73(c).

NOTE: When using digital communications, CW or phone ID is no longer required after June 15, 1983. The ID may be given using Baudot, ASCII, or AMTOR.

FACSIMILIE and TELEVISION:

Below 50 MHz the bandwidth of A4, A5, F4, F5 must not exceed that of an A3 SSB signal.

50 to 225 MHz:
The bandwidth of A4 and A5 SSB emissions must not exceed that of A3 SSB emissions.

The bandwidth of A4 and A5 DSB emissions must not exceed that of A3 DSB emissions.

Type F4 and F5 emissions shall be limited to a peak deviation of 5 KHz with a maximum modulating frequency of 3 KHz. Alternatively, the bandwidth shall be no greater than 20 KHz.

Below 225 MHz, type A4 and A3 or type A5 and A3 emissions are allowed simultaneously on the same frequency if the bandwidth is no greater than type A3 DSB.

Note: Fast Scan television transmissions may be identified using "readily legible characters when A5 emissions are used".

The present complete emission types are given in the format: "Numeral, Letter, Numeral, Letter". The first numeral indicates the bandwidth of the signal. This is often not shown (and really should be for an accurate description). The first letter shows the type of main carrier modulation. The second numeral indicates the type of modulating signal (voice, TV, CW, etc). The suffix letter, also not always shown, basically indicates carrier and sideband type information (full carrier or supressed, SSB or DSB etc). The following list is not complete, does not show pulse modes, and does not mean that all these can be used by the amateur.

TYPE	DESCRIPTION	NOTE
	(Amplitude Modulation)	
A0	carrier - no modulation	
A1	on-off telegraphy	#1
A2	amplitude modulated telegraphy	#1,2

A3 DSB (full carrier telephony)
A3A SSB (reduced carrier telephony)
A3B (2 independent sidebands - reduced carrier) #3
A3J SSB (supressed carrier telephony)
A4 DSB facsimile
A4A SSB facsimile, reduced carrier
A4J SSB facsimile, supressed carrier
A5 DSB television
A5C VSB television #4

(Frequency modulation)

F0 carrier - no modulation
F1 frequency shift telegraphy #1
F2 frequency modulated telegraphy #1,2
F3 telephony
F4 facsimile
F5 television

----------Notes----------

1. This is not restricted to Morse - may be RTTY, for example. (RTTY could be run on 160 meters if on-off keying of the carrier is used).

2. Examples of this mode are: 1) Carrier keyed on/off 2) carrier on with the modulation keyed on/off 3) carrier on with the modulation frequency shift keyed.

3. This is used by short wave broadcast station studio to transmitter links with separate programs on each set of sidebands.

4. VSB = Vestigial sideband where all of one set of sidebands is transmitted but only about 20 percent of the other set of sidebands is transmitted (the lowest frequencies).

Common Amateur emissions:

Double sideband voice = 6A3
Single sideband voice = 3A3J
VHF FM voice = 16F3
25 wpm Morse cw = .1A1

(assume max modulating freq of 3KHz and max deviation of 5KHz)

Bandwidths are found with the following formulae:

A1 Bw = BK K=5 for fading circuits)
A2 Bw = BK+2M
A3 Bw = 2M

```
    A3J   Bw = M
    A4    Bw = KN+2M    (K=1.5)
    F1    Bw = 2.6D+.55B     (when 2D/B is less than 5.5)
     Bw = 2.1D+1.9B     (when 2D/B is greater than 5.5)
    F3    Bw = 2M+2DK   (K=1)
    F4    Bw = KN+2M+2D (K=1.5)

          WHERE:

     Bw = necessary bandwidth in Hz
     B  = speed in bauds
     C  = subcarrier freq. in Hz
     D  = 1/2 the diff. between max and min instantaneous
          freq (in other words, peak deviation).
     K  = fudge factor
     M  = maximum modulating freq. in Hz
     N  = maximum black & white elements per second
          (N = drum circumference x lines per unit length
              x drum rps)
    ------------------------------------------------------------
```

As a result of WARC 79, the very familiar signals of the emissions modes will be changed. The FCC will be implementing the following new symbols over the next several years.

Old Symbol	New Symbol	Old Symbol	New Symbol
A0	N0N	F0	N0N
A1	A1A	F1	F1B
A2	A2A	F2	F2A
	A2D		F2D
A2J	J2A	F3	F3E
	J2D	F4	F3C
A3	A3E	F5	F3F
A3J	J3E	P	P1B
A4	A3C		
A5	C3F		
	A3F		

Symbol Explanation:
  First character indicates emission type
  Second character indicates the nature of the signal
  Third character indicates the type of information transmitted

First Character
  N = Unmodulated carrier
  A = Double sideband AM
  J = Single sideband, suppressed carrier
  F = Frequency modulation
  P = Sequence of unmodulated pulses
  C = Vestigial sidebands

Second Character
  0 = No modulating signal
  1 = Single channel containing digital information without the use
      of a modulating subcarrier
  2 = Same as above, except using a modulating subcarrier
  3 = Single channel containing analog information

Third Character
  N = No information transmitted
  A = Telegraphy -- aural reception
  B = Telegraphy -- automatic reception
  C = Facsimile
  D = Data transmission, telemetry, telecommand
  E = Telephony
  F = Television

Example: A1A is double sideband, single channel containing digital
information without the use of a modulating subcarrier, telegraphy
for aural reception. In other words, CW!

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
Larry:
You might wish to consider the log-periodic array as a possible
solution to solving the problem of an antenna which will give continuous
coverage over a substantial portion of the spectrum your
FRG-9600 will cover. The log-periodic is successfully used over a narrower
range, typically from about 50 MHz to about 250 MHz in the form of
common TV antennas. These arrays are referred to as "self-scaling" antennas,

that is, they are NOT frequency sensitve, and as such, offer a good match
to a fixed impedance feedline like ordinary coax over thier entire range.
Refer to W6SAI's Radio Handbook for designs spanning 140 to 450 MHz.
If you need more details, let me know. Good luck es 73 de Alex, AI2Q,

Keywords: encryption shortsightedness
Summary: Why wasn't encryption used in cellular standard

In article <154@pyuxv.UUCP> craig@pyuxv.UUCP writes:
> Congress has a measure under consideration that would
>strengthen such privacy law requirements extending protection to
>cellular and cordless telephones. Markup is expected, for both the
>House and Senate versions of the bill, by early next year. There is a
>possibility of enactment by the end of 1986.

     I have always wondered why the cellular radio standard didn't
include digital transmission under (optional?) encryption. Digital
transmission would make cellular signals difficult to intercept with
scanners or even TV sets, and the hardware required - much like a descrambler
for a broadcast tv signal - would be specialized enough so random members
of the general public couldn't legally acquire it on the pretext of
using it for some legitmate purpose (unlike TVRO's and SSB receivers !!).
For a few dollars more the system could supply DES with reasonable
key security that would make the cellular link at least as private
as the rest of the telephone system.

     The current transmission method for cellular phones is FM, and
the channel spacing is such that there would be plenty of room for
a 16 or 32 khz QPSK (or even diphase) adaptive slope (ADPCM) or

CSVD transmission of high quality voice. As for performance, I have read some claims that clever demodulators can do as well demodulating digital voice signals near threshold as nbFM.

It seems a shame that the designers of a system as sophisticated as the cellular phone system chose not to consider the security issue seriously. I beleive that most of the design work was done in the late 70's when DES chips and LSI PCM chips were at least beginning to appear on the market, certainly any far sighted system architect could have confidently predicted that the required digital hardware would soon be available and eventually be quite cheap. My guess is that low cost in the short term and reduced technological risk dominated their thinking. Perhaps someone on the net can shed some light on why the current fm based system was chosen.

The real tragedy is that the proliferation of the current generation of FM based hardware will make it very difficult to convert the whole system over to digital. Perhaps the present transmission sites can be equiped with dual mode radios that would allow subscribers to use digital transmission as an option and thus allow those who understand the risk and want to protect their privacy to enjoy the conveniance and flexibility of roaming cellular phones with a modicum of privacy too. I should think that there might be quite a market for such a higher privacy (and price no doubt) service as people begin to discover that 900 mhz scanners (and some tv sets as Bob Parnass points out) can pick up their fm conversations clearly.

Unfortunately, though the NSA has been very active in trying to raise consciousness about security, the more political FCC has yet to authorize secure digital transmission over the current 900 mhz cellular phone frequencies. One would think that the government would get its act together and lead on the issue for once by requiring that all cellular systems be equiped with dual mode capability by some future date.

The cost of digital base station transcievers at cell sites and of the required microprocessor systems for key management would be a reasonably small addition to the cost of all the required hardware at cell sites. I suspect that by charging more for a secure service the costs could be recovered (I might add that the systems in the Boston area use microwave links to tie the cells together and those ought to be secured too...). And the digital hardware for mobiles could be implemented in a small number of VLSI chips that ought not to add excessive cost, power consumption or weight to these high tech transceivers.

I have a Hustler DCX discone antenna, for which
Newtronics claims a frequency range of 40-700 MHz.
It's still in the box, so I don't know how well it
works.

A posting from Munich asks for comments on small HF rigs. A fine palce (place) to look for product reviews in "Radio Communication", published by the Radio Society of Great Britain (RSBG). Peter Hart, G3SJX, has a continuing series of very technical reviews, as well as comment from on-the-air use. Two reviews which aply to the above message are:

FT757GX in the May 1985 issue

TS430S in the June 1985 issue

These rever back to earlier similar reviews by Hart as follows----

IC740 November 1983
IC720A February 1982
FT102 January 1983
FT77 June 1984

Perhaps you will find these to be interesting..

73,

Bob W3OTC

Since when has Amateur Radio become a "source of income"?! I can understand helping a much desired DX station with postage by including an IRC (International Reply Coupon), but sending US$ to subsidize somebody's income is both against the principles of amateur radio and in violation of the law. Amateur Radio is a hobby. Let's not turn it into a business!

x
     Ever wonder about those signals that seem   to "sweep"
     across the HF band? Is it just a   bored operator twis-
     ting the VFO knob? A search of   government records
     revealed the following license:

   2.0000   KA2XNH____SRI International, experimental contract
     stn (US Navy co
                ntract N00014-83-C-0267). For sweeping the band 2-32 MHz
               in 1 Hz increments not more than 3 times per hour at a
                sweep rate of not less than 5 minutes sweep for the enti
                re band,   50w, A0 emission
                [Stanford, CA] (govt recds)

     QST carried an article several years ago on the subject
     of   sweepers. Can   anyone contribute more recent infor-
     mation regarding sweepers?

Last word on Satellite viewing freedoms:

All satellite channels may now be coded. Congress passed a law a few
years ago that they could not be coded "most of the time" until decoders
could be rented by the cable companies to the satellite viwers. They
are now available (about $12 a month). The satellite system sellers are
pressuring for a 2 year extension but it probably won't make it. Look
forward to coded (no you can't build your own decoder) reception as the
norm in the next 6mo to year. So you can forget the freedom stuff.

              Joe

The 1985 ARRL handbook devotes two chapters to just such things (Chapters
39 and 40)(Monitoring and interference). I for one do not believe that Ham
Radio is just DX reports, Rig reports, etc, etc, etc... Personally, I have
been deleting all of the recent haranging about Rig Reliability, since,
being an experimenter, I generally build it and fix it myself. Should I
propose that all of that stuff be removed to info-rig-harangue? No! Of

course not. Many Hams I know are at least mildly interested in what is happening in communication in ALL parts of the EM spectrum.

Non-Amateur Signals on 160 Meters

Bob Parnass, AJ9S

My curiosity was aroused when another ham at work mentioned hearing "beacon-type" signals on the 160 meter ham band (1.8 - 2.0 MHz).

A search of FCC (1984) and IRAC (1981) files produced a long list of American stations that, at one time or another, may be operating in this band. Note that the first few experimental licenses in the list are for operation over a range of frequencies, rather than just one or two channels:

1.8000 KF2XHE____General Motors Research Corporation, for operation in the range 1.8-2.0 MHz, experimental research stn, 100w, 3A9B emission
[Warren, MI] (govt recds)

KM2XGO____Chrysler Corporation, for operation in the range 1.8-1.85 MHz, experimental research stn, 700w, A0 emission
[Detroit, MI] (govt recds)

1.8050 KI2XIR____Ford Communication Inc, experimental research stn, 1w, A0 emission

[Dearborn, MI] (govt recds)

1.8165 KI2XIR____Ford Communication Inc, experimental research stn, 1w, 3 A3J emission
[Dearborn, MI] (govt recds)

My Kenwood TR-7950 has been having an intermittent "receive" problem which has kept the rig in the service center (and kept me off the air) for about two months now.

The problem is that, when I have a station tuned in and am listening, the rig starts to "motorboat". That is, the sound is interspersed with "squelch tail" noise several times a second, and the signal-strength LED display alternates rapidly between "strong signal" and "no signal".

I normally operate out of my car. However, these identical symptoms were seen when the rig was hooked up to an AC power supply and fed input from a VHF FM signal generator. Hence, the culprit is definitely not my car battery or antenna wiring.

The problem seems to be intermittent. Specifically, it seems to occur most often when the rig is NOT thoroughly warmed up. I was seemingly able to reproduce the problem by disconnecting the DC power from the rig, turning the power/volume switch on, and shorting the DC connector pins together briefly in the back of the rig; when I reapplied power after doing this, the "motorboating" would return for a while. I am not 100% sure whether this was really making any difference, though, because shortly after doing this several times I discovered that I had drained my car battery!

Has anyone out there had anything similar happen to them? Does anyone have any ideas? The Kenwood customer service people seem quite open to any suggestions I can supply them regarding what the problem might be or how to make the rig misbehave at will.

PLEASE DON'T use this request of mine as a springboard for any tirades about poor equipment quality or repair competence by Kenwood, ICOM, or anyone else. All I am looking for are ideas that I can either pass along to the Kenwood people or pursue on my own in case they give up.

Please mail replies directly to me if possible (my address is below).
I will post a summary to the net once my rig is working again.

Depends on what you think of as ham radio. I rather enjoy reading about
that sort of thing, as it has something technical to it. On the other
hand, if I have to read (thank G*d for rn's kill files!) one more
article about lower-than-30MHZ-conversations-with-some-unknown-little-
forsaken-island-using-some-foreign-manufactured-rice-rocket-hooked-up-
to-some-store-bought-heap-of-aluminum-for-a-grand-total-of-10-seconds-to
exchange-signal-reports, I'll puke.

Ham radio is a diverse hobby. I'm in it for the technical aspects, and
to learn more about radio, television, digital, and other modes of
communications. If I just want to talk to somebody, I'll use the
telephone. Its cheaper and more reliable.

So please! Tolerate the not-ham-radio-the-way-the-ARRL-invented-it traffic as well as the more traditional stuff here in ham-rado. Some of us like it!

Oh yes, if you want to look for me on the air, I'll be there. I rarely get below 420MHz, though.

I've had some difficulty recently in trying to resolve an apparent difference between some simple mathematical analysis and practical results in terms of some basic spectral analysis. I decided to seek the help of specialists on the net before looking at another useless textbook on the subject. I'm sure the answer must be simple but anyway here it is:

If there exists a baseband signal x(t)=Kcos(Wmt) where Wm is the angular frequency and this signal is input to a multiplier or a balanced mixer where the multiplying signal or local oscillator is y(t)=Xcos(Wlt) at frequency Wl the output is s(t)=KXcos(Wmt)cos(Wlt). This leads to an equation for the output of s(t)=(KX/2)cos(Wl-Wm)t + (KX/2)cos(Wl+Wm)t . Taking the Fourier transform of this gives a "delta" function in the frequency domain of area KX/4 at frequencies Wl-Wm , Wl+Wm and also at the negative of these frequencies (which accounts for the extra 1/2 factor. However it should be perfectly valid to work with positive frequencies and real functions of time only. The output of this would be a DSB-SC signal.

Calculating the power of these spectral components is where I
have my dilemna. The expected value or mean square power of
the baseband component is K*K/2 in a one ohm system and
the power of each component of s(t) is K^2*X^2/8 or the total
power in s(t) equals K^2*X^2/4. Assuming K=X=1 the power in the
baseband signal would be 10log(1/2) or -3dBW. The power in each
of the components of s(t) would be -9dBW. This leads to a loss
of 6dB from the baseband to one of the components of s(t).
However, in working with real double balanced diode mixers the
loss from the baseband input to the output is from 5-7dB.
Actually this loss is specified as the conversion loss from
RF to IF but this is equivalent. The manufacturer's literature
briefly states that 3dB of the loss is due to theoretical
considerations and that the rest is due to thermal and mismatch losses.
Can anyone see where my mistake is in calculating 6dB of loss?

I tried to send this by mail, but it bounced somewhere near ARPA land.

In article <2438@brl-tgr.ARPA> you write:
>Please note the manual supplied is a USERS manual, NOT a
>TECHNICAL/SERVICE manual. The manual is complete with full detailed
>descriptions of commands and control. It's internal memory can be
   Since we're all supposed to be appliance operators, I suppose that
this is okay?? Come on. Packet is still experimental in amateur operation.
Even my Kenwood TS-430, a far more complicated appliance, comes with
more technical information that the Kantronix. Also, in an emergency,
I would rather be able to fix my appliance!

>The fact that you wasted several hours during a critical emergency net
>time only shows how important it is to be prepaired!   Participate in

A slight problem here: My own equipment could not be brought into

Mexico, so we had to do with what we could get. Were you prepared for the Mexico disaster? Where were you?

>The syndrome was "...we couldn't get it to receive anything."; perhaps
>the problem was a shorted audio mini-jack? Dead/inop AC outlet/power
>supply? Not enough receive level/audio? Incomplete/inop software? I

Since neither Carlos nor myself are idiots (or appliance operators), we of course eliminated all of these problems (and many more) early on.

So, now that you have criticized the fact that we had problems, how about a little help on the Kantronix. What is that big "WORLD" chip? What pins are what?

I agree that HAMRADIO^ should be open to *ALL* information on the
TOTAL spectrum.

Scanners/antennas/dx/dishes/appliances/fcc/tv/cable/packet/vhf/uhf/hf/lw/power/
questions/answers/networks...
some topics you will like, some you won't. Resolve to be mature enough
to respect the rights of others to learn and communicate.

It is also important to note that not all members or visitors to the dl
are hams. Appeals for information are made because users know that
honest, no-sales-hype replies can be found here. I have yet to see a
open question on communications go unanswered.

While DX-reports are not my cup of whiskey, I find that my delete
option works just fine. I do, however, object when a topic becomes a
matter of personal flames and contests to see who can turn whom into
black toast faster.

I marvel and value the vast wealth of knowledge and insight here on the
DL. I strongly object to restrictions upon members, communications or
topics.

73's

The QSL information for HC8X is indeed K8CW.

If you send a card to K8CW, or to any of the operators for their /HC8
operations, don't be surprised if it is a while before you get a response.
Most of us have not had cards printed yet. In my case, I don't know
whether I am going with a simple card or a picture card, and won't make
that decision until the pictures from Galapagos are developed.

Conditions were fantastic on the high bands, allowing us to run JAs
on 10 meters, and to work long path Europe at night on 15. On the
other hand, 160 was very difficult - I hope you weren't among the folk
who were calling for hours without success.

As far as QSLs, here is a complete list

Call Via

If you worked any other call, it was a bootlegger!

We did not operate much from HC1/HC2/HC5 because of time and antenna availability, and also because Equador was not that rare.

If you worked the HC8E expedition a couple months ago, cards should be coming soon. If you want a card from them, you are probably better off sending a greenstamp, as they are unable to cash IRCs in Equador.

Anybody know anything about the Yaesu FT203R 2 meter handheld? I especially would like to know about its reliability, present cost, and personal opinions from persons having that rig. Yaesu is not a popular brand here in New England, and I'm having trouble getting information about the rig. Please send responses directly to me. Any help will be appreciated.

hr crrl bulletin nr 24 from crrl headquarters
london ont october 7, 1985
to all radio amateurs bt

the crrl headquarters has been moved into larger quarters, about 7 miles north of london. the mailing address is still box 7009, station e, london, ont n5y 4j9, but the telephone number is now 519 225 2188.

to commemorate the 100th anniversary of louis riel, manitoba amateurs may use the prefix ch4 from october 16 to november 16.

in reply to the crrl request that canadian amateurs be given access to the 24.89 to 24.99 mhz band. the minister of communications indicated that access would have to wait until a number of commercial stations assigned to the band were either confirmed as being non operational or moved to other frequencies. crrl continues to pursue the matter.

the ontario section net, osn, and quebec section net, qsn, have been replaced by a new net, oqn, ontario quebec net. ve2edo is net manager ar

qst de k9eui
hr propagation forecast bulletin nr 40 from arrl headquarters
newington, ct october 7, 1985
to all radio amateurs bt

the solar flux has been 70 or lower since september 6. the october 6 reading of 66 ties the cycle 21 record low. thus we enter what is normally known as the prime dx season with solar activity so low that even 14 mhz is borderline territory. what little dx there is on 21 mhz is mostly north south in character, and even this is rarely heard on 24 or 28 mhz.

prospects for major improvements are not bright. the few active areas on the sun in september should be showing up this week. even a small rise in the solar flux would make a perceptible improvement in 21 mhz propagation and bring at least some north south potential back to 24 and 28 mhz. flux numbers in the high 70s would help a lot this time of year, but there is no basis in sight for predicting this much improvement.

a less attractive prediction makes more sense. this september was a time of high geomagnetic activity, a degrading factor likely to be with us again october 10 through 19. we were entering a period of relative quiet at bulletin time, and this could last through about october 9. erratic and frequent ups and downs observed september 13 through 18 are likely to return about october 11 through 19. late october looks somewhat better than the first half, with the 27th through the 29th probably the best of the fall season to date, but improvements if any will be mainly on 14 mhz and lower bands.

there can be bursts of high solar activity in the late years of the solar cycle. any tangible evidence of this in prospect will be reported in special bulletins.

american sunspot numbers for september 26 through october 2 were between 0 and 3 with a mean of 0.4 ar

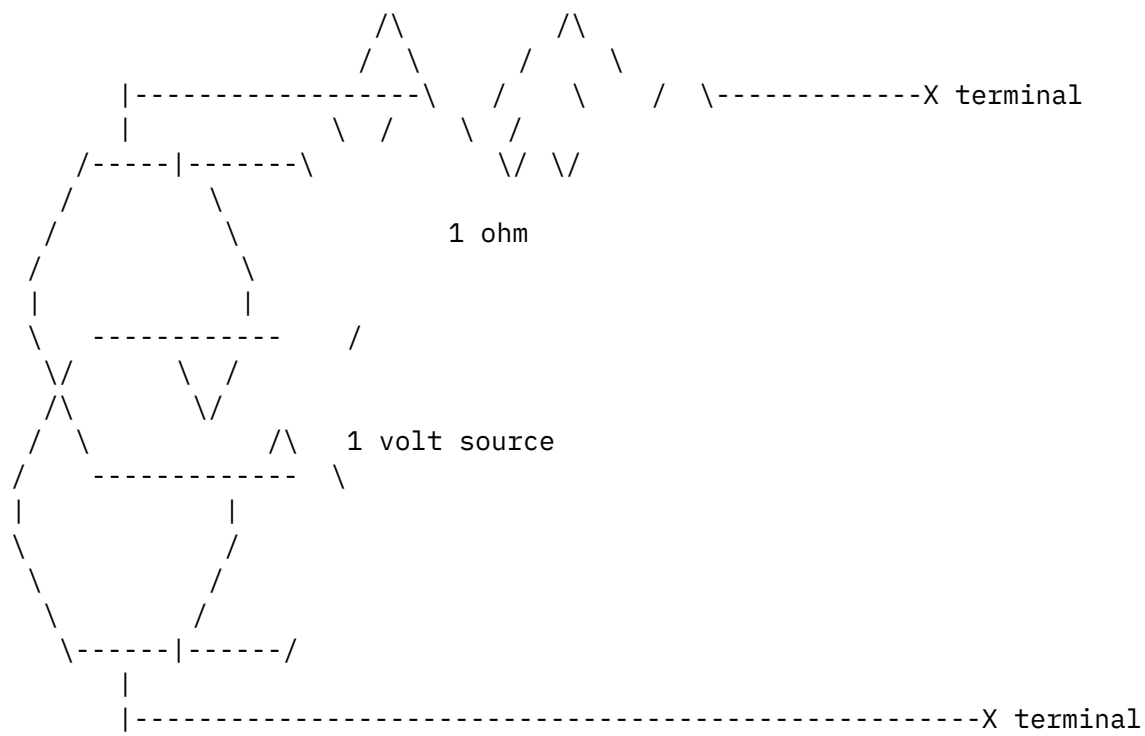
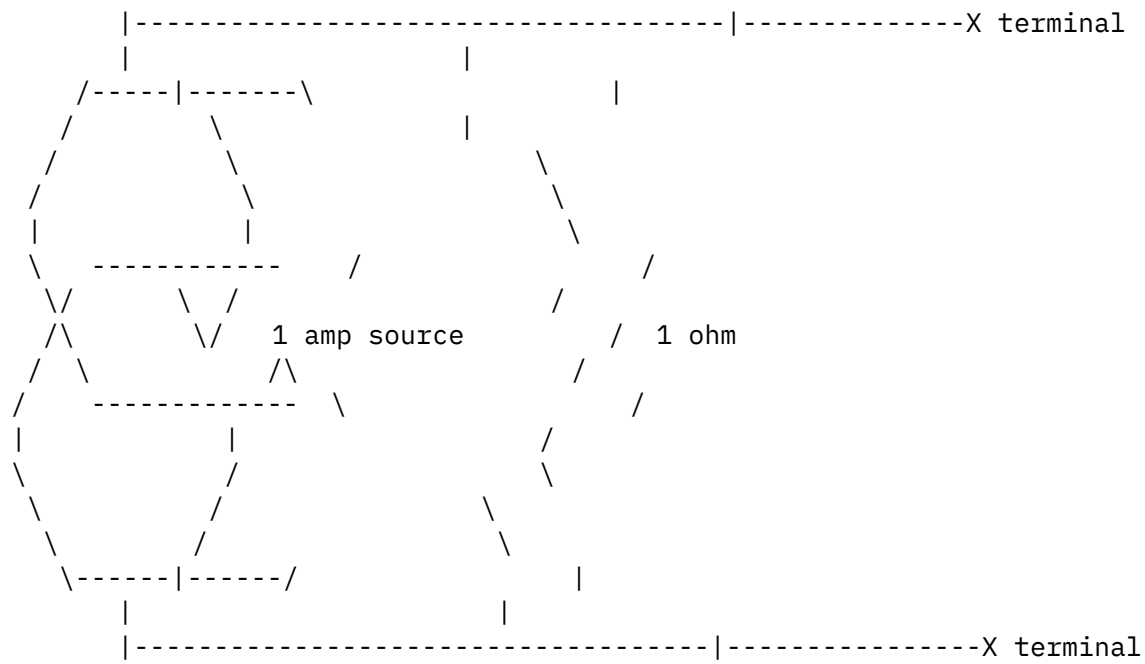
This is an old one but most people I've met have not seen it. If you
solve it in less than an hour, give yourself an 'A'.

The problem is as follows:

You are given 2 black boxes. One contains a perfect 1 volt voltage
source with a 1 ohm resistor in series connected to 2 external
terminals (assume 0 resistance wiring). The other box contains a
perfect 1 amp current source with a 1 ohm resistor in parallel with it
connected to the external terminals. Can you identify (without
opening) which box is which?

I'll post the correct answer(s).





Austin Mack

You can't, if you're allowed only to see how the two terminals behave
to external circuits; they're equivalent.

However, with the terminals open-circuited, the black box with the
current source will be dissipating 1 watt of power, while the the one
with the voltage source will not be dissipating anything. Short the
terminals and the situation reverses. Stick each box into a picnic
cooler with a thermometer, and wait. This is the only way I see to
solve the puzzle.

ICOM Corp.
2380 116th Ave. N.E.
Bellevue, Wash. 98004
206-454-7619

I'm sending in my ICOM, IC-47A, UHF transceiver, Serial Number 01862, and one HM-23 microphone for repair, per telephone conversation with Tom Moore, on October 7th, 1985. Tom stated that the repair cost will be $45.00 per hour, for labor, plus parts.

The problem with the radio is that it has an intermittent transmit, both on high and low power settings. The LEDs indicate that transmit power is being delivered, but no RF or audio is being emitted. At times, it will transmit with full power into my "Bird" watt meter and dummy load, and then quit.

I am becoming VERY disillusioned with ICOM products. I only owned this radio for five months, and already have to send it in for repairs. It's only two months out of warranty. What really aggravates me, this is not the first time an ICOM product has given me problems. At the same time I bought this radio, I purchased the matching two meter radio, the IC-27A. The IC-27A had a similar problem. Within one month after purchase, the PLL circuit went out and it would not transmit or receive. Luckily, the entire radio was replaced under warranty, from the dealer. Currently, my replacement IC-27A has developed a small, but noticeable problem. About once or twice a week, the radio will jump frequency and loose the frequency that was programmed into that memory location. I'm living with this problem for the time being. Also, eight months ago, I purchased an ICOM IC-271A, two meter all mode transceiver. I had to replace that radio THREE times, under warranty, before I got one that would work for any length of time. I selected ICOM products, because I thought I was getting top shelf, state-of-the-art, quality radios. The way that my ICOM products are holding up, I'm VERY sceptical of ever buying any ICOM products again. By adding the cost for this repair and UPS charges to the total cost of the radio, I am paying more than your competitors equal value radio. This also doesn't take into consideration, my time spent dealing with broken radios. I do own several Kenwood and Yaesu radios, and I have never had one problem with any of them.

Once the repairs are made, please notify me either by telephone, to my day time business number, or by letter, to my home address. I will then send a check to you for the repairs. What type of warranty will I receive with the repair of this radio ? All the above mentioned warranty replacements are documented.

Thank You

Ed,
  I can't speak for the rest of the people in INFO-HAMS, but here in Alabama we use two different frequencies during emergencies. 3.965 MHz after 6 PM (Alabama Traffic Net "MIKE" (ATNM) 6:30 PM CDT to about 8:00 PM. 7.243 MHz during the day, same net name. Also, listen to 14.325 (I believe) for the Gulf Coast Hurricane Net, ham stationed in National Hurricane Center gives up to the minute news; however, net gets very undisciplined occasionally.

I'm not speaking from personal experience, but close second hand
experience.

I think the "all band" Butternut vertical is about the best one
on the market. It seems to work extremely well, is easy to assemble
and adjust, etc. They're kinda expensive, like $125 or so, but seem
to be worth it. It's a somewhat more "state of the art" device than
the ones you listed.

Don't have the model number right handy, but I think there's both
an older version (80 thru 10) and a newer one (160 thru 10 including
the WARC bands).

Good DX and all that--Jim, K6ZH

Jim,

     I use the Butternut (HFV6) and find it very good. I know others
in the area who use it too. Most of them use it on the ground with only
a good ground rod driven in next to the ant ground terminal.

     Chuck...

Any of those verticals require a good ground plane to be effective. I
have used the Hygain in several configurations. It only worked when it
was not close to large metal objects and had a good set of radials. I
had real problems with the radials when mounting the antenna on the
roof. Never got that to work very well. If you ground mount it, it is
easier to get a good ground plane, but you have to watch out for others
(usually kids) who touch it while you`re operating. I have switched to
the Cushcraft R3 which is a half-wave vertical for 20-15-10 and does not
require radials. You lose the bottom bands, but avoid the radial
problem.

Ed:

The ARRL publishes a NET DIRECTORY which is available for the price of a
s.a.s.e. That used to be a 9 x 12 envelope with $.88 postage on it,
before they raised the postage rates. If I compute it right that's now
$.90.

Good luck.

It has come to me that the ARRL now states that
their "License Guide" (the big green book) is
OBSOLETE. It has been superceded by a series of
small books geared to individual license classes.

Caveat emptor.

Jim,
You didn't mention the Butternut Vertical but I would sure recommend it.
W1BBJ, Bill, Greenwich CT., has his 5BDXCC using one. I also found the
construction to be rugged. Good Luck.

A friend of mine and I desire to establish a Full-Duplex, 9600
baud RS-232 data link between our apartments. Since we cannot
use any type of "solid" media (wire, fibre, string and Dixie
cups, etc.), we have decided to look into using Gunnplexers.
I understand that there is a book (unfortunately no longer in
print) called the "Gunnplexer Cookbook" by Robert Richardson
(W4UCH/2) that has some notes on using Gunnplexers for all sorts
of things. Has anybody seen a copy of this book, knows where I
can get a copy, or has a copy to sell? Also, does anybody have
any experience with using Gunnplexers for anything at all?

              Thanks in advance,

                        Ed Morin (WB7UBD)

Guess again. Perhaps your next guess could account for why a 3/2
wavelength antenna is (462*2.95)/freq.

The .95 factor is for what is sometimes called 'end effect'. There
are capacitive effects seen at the ends of the dipole that make it
seem electrically longer than it is. The .95 is a correction for
that, so that it will come out to the right frequency.

SInce there were several people interested in WWVB, here is some additional
info that was asked for.

Publications regarding the use of WWV(B)'s transmissions and data regarding
them is available in several publications from the National Bureau of Standards:

1) NBS Special Publication #432
   NBS time and frequency dissemination services

2) Technical Note #379
   Standard time and frequency: its generation, control,
   and dissemination from the national bureau of standards
   time and frequency division

3) "Some statistical properties of LF
    and VLF propagation" by D.W. Allan
    and J.A. Barnes

To obtain these documents, write to:

    Frequency-time Broadcast Services Section
    Time and frequency division
    Institute for basic standards
    National Bureau of Standards
    Boulder, Colorado 80302

If Phil Biehl, Greg - WA9WUM, and Tom - WA7NJK, or any others are interested
in my circuits for my receive setup, send me your addresses and I will mail you
copies of what I use.

The speed of light in air is neglegibly smaller than the speed of light in vacuum. Besides capacitance seen at the ends, dipoles are made from wire with finite diameter and this also has the effect of lengthening the dipole electrically. This effect is usually small at HF, but can be pretty significant at VHF and above. It also affects the feedpoint impedance.

See the 1985 ARRL Handbook, page 17-3.

THERE IS A NEW OPEN DATA BANK ON THE AIR.

IT CONTAINS RADIATION EFFECTS DATA FOR TOTAL DOSE AND SINGLE EVENT UPSET (SEU)
TESTS CONDUCTED FOR NASA AND DOD.

IT IS EASY TO OPERATE.

PHONE   818-354-5125

NAME   RADATA

PASSWORD READ

PROT: 8 BIT
          1 BIT STOP
          NO PARITY

          AUTOMATIC 300 OR 1200 BAUD

PLEASE FEEDBACK ANY COMMENTS OR PROBLEMS. THE DATA BANK IS NEWLY ON THE
AIR AND WE WOULD LIKE TO GET ALL THE BUGS OUT...IF THERE ARE ANY.

Yes, yes... I said that the 0.95 fudge factor used to calculate the length of
a dipole was due to a shift in the speed of light (electromagnetic propogat-
ion) traveling thru air.

Well, I was wrong. Dead wrong!

I spoke with a new guy in our research group here at Tektronix and he has
shown me the folly of my beliefs. He even gave mathematical proof that the
fudge factor comes from END EFFECTS. Not speed shifts. (By the way, the speed
shift is very minor.)

So if anyone wants to flame on this one... forget it! I beat you to the punch.

Using the famous words of a politician cought off guard: `I know that!'

Tom...

I needed repairs on my Icom IC245 and after three attempts with
ICOM-Washington, one trip to Icom-Texas repaired the problem.

Apparently the problem was built-in... foil lifting from the PWBA! The
repair was called a "jumper-job"... It cost me $65 plus time and
postage. I feel an honest company would have stood behind the product
and repaired the problem without cost.

Much like the issue with the Kenwood VHF Power Modules... If the arrl
really had it's stuff together, they would have brought a class action
against Kenwood on behalf of all American Radio Operators... A
strong message to all ham radio manufactures that we are fed up with
poor design/engineering and won't take it any more!

Thanks to everyone for all the replies to my previous posting. Many
of you answered (correctly) that the boxes are indeed electrically
equivalent, but the heat generated by current flowing through the
resistor will cause the Norton box to be warm. I think Jonathon E.
Quist (ihnp4!laidbak!jeq) had the best summary. In addition to the one
box being warm, he proposed suspending both boxes by a thread. The
norton box will align itself with the Earth's magnetic field!

                    Thanks again, Austin Mack

Up to the minute news from the worlds of amateur radio, personal computing and emerging electronics. While no guarantee is made, information is from sources we believe to be reliable. May be reproduced providing credit is given to The W5YI Report.

In this issue:

- A Special Report on Broadcast Use of Amateur Radio

HamNet thanks Fred Maia, W5YI, for permission to excerpt this Electronic Edition of his W5YI Report. The full ten-page biweekly newsletter is available by mail for $21 per year from Fred at Dept. C, PO Box 10101, 75207. Samples available for a 2 stamp large SASE.

: :

The W5YI Report, even though a VEC in all regions, has been given permission by the FCC to distribute license preparation materials as a convenience to applicants and VE's. All manuals contain ALL questions, answers and discussion why the answer is right! You can order the

guides from The W5YI Report, Dept. C, PO Box 10101, Dallas, TX 75207. The following guides are available:

FCC-Novice Study Guide	$3.00 + $1.00 Postage
FCC-Novice Element 2 Test	$1.00 + $0.50 Postage
FCC-Tech/General Study Guide	$5.00 + $1.50 Postage
FCC-Advanced Study Guide	$5.00 + $1.50 Postage
FCC-Extra Class Study Guide	$5.00 + $1.50 Postage
FCC Part 97 Rules Book	$3.00 + $1.50 Postage

: :

Note: Would you like to become a Volunteer Examiner under The W5YI Report program? If so, please send a copy of your Extra Class license, the following statement, and an SASE to:

W5YI - VEC - Dept. C
PO Box 10101
Dallas, TX 75207

You will also receive a booklet on how the Volunteer Examination program operates and how to go about giving tests. A certificate (optional) is also available for $1.00. Details and accreditation materials will be sent to you within a two week period. Include the following statement with your VE request:

"I am a currently licensed Extra Class amateur radio operator and wish to be a Volunteer Examiner. I have never had my station or operator license revoked or suspended. I do not own a significant interest in nor am an employee of any company or entity engaged in making or distributing amateur radio equipment or license preparation materials. My age is at least 18 years old."

: :

Do you have Amateur Radio news to contribute to The W5YI Report? If so, please call (817) 461-6443 and leave a message on Fred's recorder!

o Broadcast Use of Amateur Radio - Mexico City

To what extent can amateur radio be used by broadcasters during an emergency? That is really the big amateur radio story to come out of Mexico City. Powerful tremors rocked the world's second most populated city on the morning of September 19th downing phone lines and knocking out long distance communications.

Quickly reacting to the disruption in commercial communications, the news media for the first time established logistical radio circuits right in the middle of the ham bands. They said the "new rules" allowed

it. Radio and television news correspondents and anchors converged on Mexico City... their travel and support coordinated on amateur radio by broadcast hams.

Journalists, concerned with only one objective, reporting the news and getting their people and equipment in and out of Mexico City, were annoyed with other amateurs interfering with their transmissions. Broadcasters more or less took over the ham bands. Media people are very aggressive and do whatever it takes to report the news. As a mass, ham operators were completely confused!

Angry amateurs wanted to know "How can this legally happen?"..."Doesn't the FCC forbid news gathering and transacting business on amateur radio?" They heard of 'new rules' from transmissions that they monitored but didn't know what they were. My phone rang off the hook... "What did I miss? Why doesn't the amateur radio community know about them... Why didn't you report them?" ... You can use ham radio for reporting an emergency, but you can't use it to report on an emergency. When did that change? Just take a listen to twenty meters... you won't believe it!"...and on and on! Quite honestly, it caught us by surprise, too.

While I did make a couple of phone calls before the last issue went to press, there wasn't time then to investigate the broadcast use of ham radio in detail. One thing became apparent. I wasn't the only one getting complaints. The FCC got them by the dozen.

HISTORY: BROADCAST USE OF HAM RADIO

Nearly seven years ago the National Association of Broadcasters (NAB) filed a petition seeking to allow CBers and amateurs to transmit emergency and public safety information for broadcast and broadcast related purposes.

The Commission ruled (on March 15, 1979) that amateurs were prohibited from participating in these communications... no exceptions. CB, on the other hand, could be used for news gathering - although not for broadcasting to the public - since "business" could legally be conducted there.

In 1982, Congress modified Section 605 of the Communications Act to eliminate the statutory prohibition on the unauthorized interception of amateur and CB radio transmissions. In a sentence, amateur communications were no longer to be considered private. Section 605 was redesignated Section 705 in 1984.

THE GRENADA INVASION NEWS BLACKOUT

Many questions arose during the United States invasion of Grenada in October of 1983 concerning broadcast use of amateur radio. The media was prevented from covering the military action by a Department of Defense news blackout. Newsmen were herded onto nearby Barbados Island and prevented from going to Grenada. They weren't happy.

The only news link as to what was going on in Grenada came from a medical student who happened to be a ham operator. He reported the invasion to the world from under a table at the medical school campus. Broadcasters, starving for news, began reporting and rebroadcasting his transmissions. The FCC issued cautioning bulletins as to what the media could and could not do on amateur spectrum.

COMPREHENSIVE REVIEW UNDERTAKEN

In light of the uncertainty about broadcast use of amateur radio, the FCC adopted a Notice of Proposed Rulemaking on July 12, 1984. The Notice set forth specific proposals for eliminating restrictions and procedures with respect to rebroadcast activity and for rewriting portions of the amateur rules to clarify the Commission's policy with respect to use of amateur facilities for broadcast purposes.

Up until this point, broadcasters had to obtain permission from the station licensee and the FCC before personal radio transmissions could be rebroadcast in the media. Amateurs weren't allowed to engage in any form of broadcasting to the public, but could give rebroadcast consent provided that the transmissions did not contain any reference to the airing. Broadcasters were precluded from interacting with ham operators since Part 97.114 prohibits use of an amateur station for third party communications involving compensation or business.

JUST WHAT ARE 'THE NEW RULES'?

On June 7, 1985, the FCC finally released their ruling entitled "Rebroadcasts of Transmissions of Non-Broadcast Radio Stations." It was printed in the June 18th Federal Register (...pages 25241 to 25247 if you want to read it at your public library). We reported on it in our July 1st issue.

It set forth the following rule changes:

(1.) - The FCC eliminated the prohibition on rebroadcasts of Personal Radio Service communications stating that they "were sensitive to the First Amendment rights of broadcasters and do not wish to impose any regulation that might necessarily restrict broadcasters access to information sources."

(2.) - The FCC was concerned in 1984 that their amateur rules "might be insufficiently specific with respect to (their) intent that they prohibit all activities involving use of amateur stations for broadcast purposes." They proposed to "resolve this by rewriting pasts of the amateur rules and including a specific prohibition on the use of amateur stations for broadcast news gathering and other program production purposes."

Two powerful broadcast organizations, the National Association of Broadcasters (NAB) and the Radio-Television News Directors Association (RTNDA) supported bona fide news event gathering by amateur radio when other telecommunications facilities were not available or inadequate.

NAB membership includes more than 4,500 commercial radio stations, 800 television stations and the major commercial broadcast networks. RTNDA is a professional journalism organization of more than 2,000 news directors and others involved in supervising, reporting and editing news programs. Both groups are very well funded.

The ARRL opposed their position saying it was overly broad and inconsistent with the noncommercial nature of the amateur radio service.

THE NEW AMATEUR RULES - PART 97.113

The final FCC amateur rules clearly prohibited use of amateur stations for broadcast news gathering or production as originally proposed. Part 97.113 was rewritten to make this crystal clear. There were no exceptions! The FCC said in new Part 97.113 that...

(a.) An amateur station shall not be used to engage in any form of broadcasting, that is, the dissemination of radio communications intended to be received by the public directly or by intermediary relay stations...

(b.) An amateur station may not be used for any activity related to program production or news gathering for broadcast purposes.

(c.) An amateur station shall not retransmit programs or signals emanating from any class of radio station other than amateur except for emergency communications which were redefined by the Commission to ensure against any misinterpretation.

The redefinition of "Emergency Communication" (Part 97.3(w) is "A non-directed request for help or a distress signal directly relating to the immediate safety of human life or the immediate protection of property." The key word is non-directed. It was a very narrow and clear definition.

PARAGRAPH 22 OF THE FCC ORDER...

The FCC acknowledged, however, that broadcasters had sought a much broader application of amateur radio to broadcast purposes. The RTNDA and the NAB wanted to use amateur radio circuits when commercial facilities were not available. Ham operators...and communications...are always readily available. There are few remote locations where a ham station is not already set up and operational. Broadcasters wanted to use them.

The FCC decided not to provide for any "unnecessary exceptions in the amateur rules which could needlessly encourage unauthorized broadcast related amateur transmissions." At least that is what they said in one portion of the Order...

THE BROADCAST LOOPHOLE EMERGES...

In another, the FCC said RTNDA's needs could be accomodated by a "rule

of reason." While never appearing in the written amateur rules, the Commission wrote in paragraph 22 of their Order that...

"Conveying news information directly relating to an unforeseen event which involves the safety of human life or the immediate protection of property falls within this rules of reason, if it cannot be transmitted by any means other than amateur radio because of the remote location of the originating transmission or because normal communications have been disrupted by earthquake, fire, flood, tornado, hurricane, severe storm or national emergency."

The Commission further added that "We believe acceptable uses of amateur radio in emergencies are governed by traditional common sense interpretations..."

RTNDA AND NETWORKS INTERPRET RULES

When broadcasters received the new rules last June, they took particular note of paragraph 22. Here was a loop-hole in the ruling. The RTNDA's legal counsel, Larry Scharff of the Washington law firm of Pierson, Ball & Dowd, put out a "Special Report" in August that was very widely distributed. Every newsroom across the country got it.

In it, Scharff said that the FCC's Order was complex when applied to their request for increased journalistic use of ham radio during an emergency. The RTNDA published paragraph 22 of the Order in their Special Report. While acknowledging that the FCC generally reinforced its rules prohibiting ham radio stations being used for broadcast purposes - the RTNDA opinion to news broadcasters said the paragraph...

(1.) - "...went beyond its new non-directed 'distress call' emergency communications definition to include transmitting news information during a disaster when normal channels have been disrupted."

He was right! While paragraph 22 used the word "emergency", it also related it to "conveying news information directly related to an unforeseen event..."

(2.) - ...the FCC is not expected to interpret the "safety of human life... the immediate protection of property... or the newly adopted 'emergency' rule" requirements 'narrowly.'

(3.) - "...the FCC condones 'common sense interpretations' of ham radio use in emergencies."

(4.) - "...it is the RTNDA's legal opinion 'that paragraph 22 permits cooperation between broadcasters and ham operators in such instances as immediate post-hurricane or immediate post-plane crash coverage, even when there is no immediate threat to life or property..."

(5.) - News organizations were advised to have their attorneys review the new rules "to determine the extent to which ham facilities may be used for broadcast purposes."

ARRL ASKS FCC TO RECONSIDER

While it never made it to the rules, the League also noted paragraph 22. They filed a Petition for Reconsideration on the emergency communications definition and criticized the "rule of reason" broadcaster/ham operator cooperation approach taken by the Commission. Another amateur, David B. Popkin, W2CC, of New Jersey, also took issue with the ruling.

Both said there were shortcoming in the Order. The League said that clear parameters for amateur operation during emergencies should be stated in the amateur rules. In responding to the two Petitions for Reconsideration, the NAB and RTNDA jointly agreed that a clarification of paragraph 22 was needed.

"NAB and RTNDA believe that in paragraph 22 of the Report and Order, the Commission essentially has adopted our recommendation that amateur radio operators be allowed to cooperate voluntarily with broadcasters for news gathering and reporting purposes when information about extraordinary and significant events cannot be transmitted by other means of communication," their August 26th comments on the Petitions for Reconsideration read.

"The paragraph specifically states that the new rules permit amateur radio cooperation with journalists in certain situations and refers approvingly to examples offered by the RTNDA in its comments in this proceeding, including the use of amateur radio during 'severe weather and seismic conditions, ...tornados after they have struck and severed all other communications systems, ...rapidly moving forest fires ...(and) an airline crash in a remote area.' These definitions clearly go beyond the definition of emergency communication adopted in the Report and Order...'a non-directed request for help or a distress signal'"

NAB, RTNDA REQUESTS CLARIFICATION

The NAB and RTNDA again in August asked that the FCC "adopt, as an exception to the prohibition against business communications and broadcast related activities of amateur radio, a provision that would allow voluntary cooperation between an amateur operator and a broadcast journalist for news gathering and reporting when information concerning extraordinary and important news events cannot be transmitted by other means of communications."

The NAB and RTNDA said that "At minimum, the Commission should add a footnote to Part 97.3(w) stating:

> For purposes of amateur radio operators cooperating with the news media in certain emergency situations, a "rule of reason" will apply.

They also added that without further clarification "...that aids the

free flow of information to the public, the Commission's new rules raise serious dum qrocess and First Amendment issues." The NAB and RTNDA again "urged the Commission to adopt rule changes that would permit amateur radio operators to cooperate with journalists for news gathering and reporting purposes when information concerning extraordinary and important events cannot be transmitted by other means of communication."

MEXICO CITY LEVELED BY EARTHQUAKE

All of this... the legal interpretations by the networks and their industry association counsels... the Petitions for Reconsideration... the Comments on them... the RTNDA "Special Report"... was going on between July 1st and the end of August.

On the morning of September 19th, Mexico City was devastated by a terrible earthquake that killed over 5,000... and knocked out most, but not all, long distance communications. Satellite circuits were still available and used to transmit video and telephone communications out of the city.

Freshly armed with all of the high priced legal opinions, reports, and interpretations of what the FCC said in their June Report and Order could be done on the ham bands during an "emergency", the media took matters into their own hands. They established amateur radio logistical and news gathering links which they maintained were legal and specifically provided for. They had been given an inch... they took a mile. In effect, broadcasters "tossed the ball" into the FCC's "court" and have now forced a confrontation.

One thing is known! The Commission never intended to provide for any amateur radio circuits being used for news media support, period! The FCC went to great pains to preclude it. Still, their handling of paragraph 22 remains a mystery.

We have talked to officials in the FCC's Private Radio Bureau and they are as surprised as anyone over the extent that amateur radio was used by the broadcasters. "We thought we put an end to all of that (amateur spectrum use by broadcasters)," I was told.

We will have to wait and see how they deal with it. This story is undoubtedly not over!

o IN THE DAYS OF THE COMET

o DXCC, NO-NO

o FCC: YES TO FEDERAL PREEMPTION

o ...and much more!

FCC: "YES" TO FEDERAL PREEMPTION!

"State and local regulations that operate to preclude amateur communications in their communities are in direct conflict with federal objectives and must be preempted." So saying, FCC, on September 16, 1985, adopted a Memorandum Opinion and Order in PRB-1, granting ARRL's request for limited Federal preemption over state and local regulations involving Amateur Radio facilities. In filing its request, the League had acknowledged the need for local authorities to regulate Amateur Radio facilities to the degree necessary to insure the safety and health of community residents. But, ARRL argued, such regulations must not be so restrictive that they could preclude effective amateur communication.

FCC's Opinion picks up the tale with a discussion of local ordinances: "Conflicts between amateur operators regarding radio antennas and local authorities regarding restrictive ordinances are common. The amateur operator is governed by the regulations contained in Part 97 of our rules. Those rules do not limit the height of an amateur antenna but they require, for aviation safety reasons, that certain FAA notification and FCC approval procedures must be followed . . . on the other hand, local municipalities or governing bodies frequently enact regulations limiting antennas and their support structures in height and location, e.g. to side or rear yards, for health, safety or aesthetic considerations. These limiting regulations can result in conflict because the effectiveness of the communications . . . from an amateur station are directly dependent upon the location and the height of the antenna. Amateur operators maintain that they are precluded from operating in certain bands allocated for their use if the height of their antennas is limited by a local ordinance." Examples of restrictive local ordinances were submitted by several amateur operators in PRB-1.

"Other limits are enacted by local jurisdictions," said FCC, "--anti-climb devices on towers, or fences around them; minimum distances of towers from property lines; and regulations pertaining to the structural soundness of the antenna installation. By and large, amateurs do not find these safety precautions objectionable. What they do object to are the sometimes prohibitive, non-refundable application filing fees to obtain a permit to erect an antenna installation and those provisions in ordinances which regulate antennas for purely aesthetic reasons."

FCC touched upon restrictive covenants, noting that such

covenants (contained in the deeds for homes or in apartment leases) are contractual agreements between private parties and, as such, "are not generally a matter of concern to the Commission. However, since some amateurs who commented in this proceeding provided us with examples of restrictive covenants, they are included for information."

Who came out in support of PRB-1? Answer: the American Red Cross, the Department of Defense, and city and county civil defense groups, who agreed that overly restrictive antenna ordinances would adversely affect the success of disaster relief efforts, national security and emergency preparedness operations. The Quarter Century Wireless Association also took a strong stand in favor of limited federal preemption.

On the adversarial side, subdivision associations, the National Association of Counties (NACO), American Planning Association (APA) and the National League of Cities (NLC) were opposed to federal preemption. The subdivision associations maintained that amateur installations constitute safety hazards, cause interference to home electronic equipment, and detract from the value of surrounding property. NACO warned that federal intrusion into local concerns of health and
safety would weaken traditional police power and unduly interfere with legitimate activities of the state. APA and NLC maintained that federal and local interests could be accommodated without preemption of local authority.

The Commission took a long hard look at all of this while pro and con parties crossed their fingers. And in the "Discussion" section of the PRB-1 Opinion, the first words touched upon a document important to us all: "When considering preemption, we must begin with two constitutional provisions. The Tenth Amendment provides that any powers which the constitution either does not delegate to the United States or does not prohibit the states from exercising are reserved to the states. These are the police powers of the states. The Supremacy Clause, however, provides that the constitution and the laws of the United States shall supersede any state law to the contrary . . . given these basic premises, state laws may be preempted in three ways: First, Congress may expressly preempt the state law . . . or, Congress may indicate its intent to completely occupy a given field so that any state law encompassed within that field would implicitly be preempted . . . finally, preemption may be warranted when state law conflicts with federal law . . . the situation before us requires us to determine the extent to which state and local zoning regulations may conflict with federal policies concerning amateur radio operators.

"Few matters coming before us present such a clear dichotomy of viewpoint as does the instant issue . . . cities, counties, local communities and housing associations see an obligation to all of their citizens and try to address their concerns . . . at the opposite pole are the individual amateur operators and their support groups . . . [and] aligned with the operators are such entities as the Department of Defense, the American Red Cross and local civil defense and emergency organizations who have found in

Amateur Radio a pool of skilled radio operators and a readily available backup network . . .

"Preemption is primarily a function of the extent of the conflict between federal and state and local regulation . . . we recognize here that there are certain general state and local interests which may, in their even-handed application, legitimately affect amateur radio
facilities. Nonetheless, there is also a strong federal interest in promoting amateur communications . . . upon weighing these interests, we believe a limited preemption policy is warranted. State and local regulations that operate to preclude amateur communications in their communities are in direct conflict with federal objectives and must be preempted.

"Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the amateur operator with the communications that he/she desires to engage in. For example, an antenna array for international amateur communications will differ from an antenna used to contact other amateur operators at shorter distances. We will not, however, specify any particular height limitation below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. [Emphasis added.] Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety or aesthetic considerations must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation to accomplish the local authority's legitimate purpose."

So the preemption issue is not cut and dried. How many towns, villages and cities are there in the United States, with how many properties, how many citizens, how many amateurs in each town? The 11-page document we call PRB-1 is not an instant cure-all for difficulties we face now, nor does it guarantee friendly agreement on the placement of antennas and antenna supports everywhere in future. Yet, FCC feels it has provided a valuable tool in PRB-1. "Obviously, we do not have the staff or financial resources to review all state and local laws that affect amateur operations. We are confident, however, that state and local governments will endeavor to legislate in a manner that affords appropriate recognition to the important federal interest at stake here and thereby avoid unnecessary conflicts with federal policy, as well as time-consuming and expensive litigation in this area. Amateur operators who believe that local and state governments
have been overreaching and thereby have precluded accomplishment of their legitimate communication goals may, in addition, use this document to bring our policies to the attention of local tribunals and forums."

W1AW carried news of the release of PRB-1 within minutes of

its receipt from Washington. November QST will carry its full text -- food for thought, a tool waiting to be used, and recommended reading.

FCC SCUTTLES WAITING PERIOD FOR RE-EXAMINATION

Effective November 8, 1985, FCC has amended the amateur rules to eliminate the 30-day wait before an applicant for an amateur examination may retake a failed examination element. This action, in PR Docket 85-21, is the result of a petition filed by Phil Miller, KB8QX, in 1984. Miller had requested that the waiting period for retaking an amateur exam be reduced from 30 days to 7 days. FCC's Notice of Proposed Rulemaking proposed elimination of the waiting period altogether, and included a proposal to require public announcement only of examination sessions intended for five or more candidates. The extant rule required Volunteer-Examiner Coordinators to publicize all exam sessions.

In its Report and Order on 85-21, the Commission opened with discussion of the retest waiting period. "Commenters favoring complete elimination of a waiting period are of the belief that without a waiting period, amateur applicants would have more incentive to study and retake the examination." The other of the two basic positions was characterized by the Commission as more multifaceted: "Commenters who favor retaining a waiting period before retaking an examination element believe that an interval is necessary to preclude answering the examination questions mechanically or unthinkingly as a result of repetitive rote learning. They do not want a candidate to encounter the same questions on subsequent examinations. They also feel that it would be an undue burden on Volunteer-Examiner Coordinators to prepare new examinations more than once a month, resulting in increased costs. These commenters also oppose the idea of allowing each VEC the latitude to establish a waiting period to suit its own capabilities, stating that it would lead to confusion and loss of program integrity."

ARRL was one of the commenters arguing in favor of retention of a waiting period; it asked for 27 days. The idea behind this reduction by three days was that the 30-day wait often causes a person to miss the next exam where examination opportunities are offered monthly.

The Commission countered that the aim of the 30-day waiting period had not necessarily been that of guaranteeing the integrity of the examination and successful exam candidates. It was, instead, "a carry-over from the days when the Commission administered the examinations. While it may promote conscientious preparation for examinations, its purpose was to conserve Commission resources. If concerns for integrity can be satisfied, we see no need to restrict the remarkably flexible volunteer examination system with outdated prohibitions." The Commission next turned its guns on the question of whether the waiting period ever improved the quality of the knowledge of applicants who had to wait before successful retesting. "There

is no persuasive evidence in the record that an applicant who has waited 30 days between tests will be better prepared for the next test than one who has waited 27 days, or 13 days or 7 days or any other period of time. Thus, we feel that the only circumstance which must be guarded against is the administration of the same questions at the applicant's next examination. Our instructions to the VECs already prevent this from occurring. VECs have been instructed not to use the same set of questions in successive examination sessions. This prevents, for example, Friday test takers from giving advance information to Saturday test takers. It also precludes the possibility of the same questions on reexaminations. Different VECs can and do coordinate examination sessions at different events in the same locality. Since each VEC makes up its own test designs following our algorithm, it is highly unlikely that examination sessions coordinated by two different VECs will contain the same questions . . . we conclude that the public interest will best be served by eliminating the retest waiting period altogether. This decision adds no additional burdens on VECs. They are under no obligation to give tests on demand, to hold sessions on multiple dates, to examine more people than they can plan for or accommodate, to promptly return to a locality for retesting or in any other way to alter their present procedures. Their only obligations are to maximize the number of different examinations in use and to change frequently the questions used. These obligations already exist."

So, retention of the waiting period, any waiting period, was blown out of the water. What about requiring public announcement only of exam sessions intended for five or more candidates? ARRL had opposed the proposal, saying that no examination should be private, i.e., without public announcement -- that unannounced "back room" exams promote abuse or the perception of possible abuse, and that exams should be in the public eye to insure integrity. If the Commission did decide to eliminate the public announcement of exams, said the League, it should be done not on the basis of the number of persons present, but rather on the basis that special exceptions are made for those who are handicapped or who cannot leave their homes because of a disability. The Central Vermont Amateur Radio Club also opposed deletion of the public announcement requirement.

FCC's reply was that no matter where an exam was given, it had to be given by a team of three examiners, each of whom had to be accredited by a VEC. "This circumstance alone is calculated to preclude fraudulent examinations. Nevertheless, in view of the comments, we will continue to require that public announcement of all examinations be given." Recognizing that the number of exam candidates at any one exam session may be limited, FCC will require that public announcements of exams alert the public to any such limitation.

To update your copy of the FCC Rule Book, revise paragraph (a) of Section 97.26 to read:

(a) Each examination for an amateur operator license must be administered at a place and time chosen by the examiner(s). The

number of candidates at any examination session may be limited. Public announcement must be made before all examinations for elements 1(B), 1(C), 3, 4(A) or 4(B).

Paragraph (h) of Section 97.26 is removed and reserved.

PRIBILOF ISLANDS WILL NOT BE A NEW ONE FOR DXCC

On September 17, the ARRL Awards Committee voted 7-0 that the Pribilof Islands not be added to the DXCC Countries List -- this after the DX Advisory Committee had recommended addition of the Pribilofs to the list by a 9-7 vote. Country status was not conferred because the Pribilofs are less than 225 miles away from the Aleutian Islands -- which are part of the "governing area" of Alaska -- and as such were judged to fail the test of DXCC Countries List Criteria Rule 2(a). The "mainland" reference in 2(a) was seen only as clarifying the situations to which the Rule itself applies.

IN THE DAYS OF THE COMET

On October 8, the Earth will pass through the orbit of Comet Giacobini-Zinner (phonetically: "jock-o-benny zinner") only 25 days after the comet's passage. Experts have estimated that this might produce 6,000 to 10,000 meteors per hour. For comparison, we've tended to consider the annual Perseids shower a high producer with its "mere" 40 to 60 meteors per hour.

With the advent of packet radio, we have an excellent opportunity to collect data on the effect of meteor showers on VHF communications. It is suggested that from 0500Z to 2100Z on October 8, packet stations use 28.0985, 50.65 and 145.09 MHz. Send CQ every 10 seconds and your grid square locator. In between, monitor and capture all incoming transmissions. Please send reports to: Wake Digital Communications Group, c/o Ed Stephenson, AB4S, 700 Madison Avenue, Cary NC 27511. A summary and report will be prepared for QST -- Will Harper, K4IWW

EARTHQUAKE IN MEXICO--AND HURRICANE GLORIA Disaster struck Mexico on September 19 when an earthquake measuring 7.8 on the Richter scale, centered 40 miles off the west coast of Mexico, devasted coastal areas and brought down highrises in Mexico City, including hotels and a hospital -- official reports say at least 4000 have died.

One week later, Hurricane Gloria raked the Eastern Seaboard with winds topping 100 mph, and energy outages widespread.

Amateur Radio jumped into the breach in both emergencies -- watch QST for details.

40 Meters has been lots of fun lately, with the FT8X station (FT8XA and FT8XB apparently share a station) being workable from Massachusetts both long and short path. There has not been a whole lot going on in the morning, though.

The big news around here is the DL9ON/S9 and DK9DX/S9 (I may have those calls wrong, I'm working without notes) expedition. They have been on 20 CW at 14025, and 20 SSB at 14195 listening 14200-14215. There was some question as to whether they would have permission to operate on the low bands. They have been on 40 meters CW, transmitting at around 7001 and listening up, every evening starting at 2200Z or before. Last night they showed up on 80 meters! I worked them at around 2350Z, and they were gone by 0030Z. Not a very big signal, but I won't complain! They were working transceive on 3501, and went split when the pile-up got bigger.

Also, FT8XB finally showed up on 80. He was transceive on 75 meters, 3795 at around 0100Z a couple days ago. Needless to say, it was a bit of a mess, especially for those of us without beverages...

N7DF/TT8 has apparently moved into his new quarters. He was on 160 meters last night. Or at least the people with the beverages think so, I couldn't hear him. I expect to hear him on 80 meters soon.

Conditions on Sunday were excellent, with 15 meters having a SOLID opening to Europe and Africa. I worked 5X5GK on 15 meters SSB, and ZB2EO (for my sixth band) on 15 meters CW. There was plenty of good stuff on 20 SSB also, including 9X5, ZD7, and D68.

Next week, starting probably on 22 October, there should be a lot of activity from Galapagos, HC8. A group of about 15 operators is setting up for a CQ WW SSB multi-multi. I'm one of the operators. We will have 4 element monobanders on 10, 15, and 20, a short yagi on 40, phased verticals on 80, a short (60 to 80 feet) vertical on 160, beverages, and amplifiers on all bands. Look for us using our USA callsigns portable HC8 on CW before the contest, and as HC8X on SSB during the contest. QSL via the home call for the portables, and via K8CW for the HC8X contest QSOs. We also will try to be active on 10 and 30

meters before the contest. Please stop by and give us a point in
the contest!

Ade Weiss' address is

c/o Milliwatt Books
833 Duke St., #83
Vermillion, SD 57069

His writeup costs $7.00 (proceeds used to support the
Milliwatt Trophy program). He also has a book out,
"The Joy of QRP: Strategy for Success" which costs
$10.95 pp. I recommend both.

Fred Bonavita writes the QRP column for Worldradio,
and I got his address from the byline on his column.
Unfortunately, his column did not appear this month,
so here is his address from the callbook (hope it
is current !):

Box 12072 Capitol Station
Austin, TX. 78711

His "Hot Water Handbook" costs $5.00, and is well
worth it. I'm at home now, but I think I have an
old copy of Worldradio at work. I'll get back to
you if this address is not correct.

Good luck with your HW-8 ! I certainly enjoy mine,
and also use a (much modified) HW-7 and an Argonaut.

73,
Jeff Rininger

Tom Boza is not alone in his frustration with Icom and radios
sent back for repair. I have an Icom R-70 that has been back to the
factory at a cost of $100 to replace the main CPU chip. The cost of
shipping and hourly repair charge could make a $200-300 unit almost
a throw away unit if it needs service. My Icom 47-A also has a problem
that I have lived with since I got it last year. The transmit carrier
has a PLL loop whine that is quite noticeable. Icom says they are aware
of the problem but have no fix. I spent $415 for a high quality radio
only to be told that is the way it is and you'll have to live with it.
By the way I also own Kenwood VHF and HF equipment and have no problems
with any of it!

qst de k9eui
hr propagation forecast bulletin nr 41 from arrl headquarters
newington ct october 14, 1985
to all radio amateurs bt

the very low level of solar activity continues. in 24 days
beginning september 19, the solar flux averaged only 67.7, and
never was above 69. only july 1976, in the first month of
solar cycle 21, can match the solar calm of september and
october, to date. a typical result, for this connecticut
observer, is that 14 mhz is almost completely a daylight dx
band. even the old reliable 10 mhz wwv signal is gone by about

0130 utc, until about an hour after sunrise the next morning. the 21 mhz band is marginally useful from mid morning to dusk but mostly to the lower latitudes. only an occasional day provides any propagation on 24 or 28 mhz, and that for only a few hours of north south work. the 10 meter beacons in the range 28.2 to 28.3 mhz come through briefly on the best days, but only those in south america are heard currently.

prospects for the forecast week are for erratic conditions through about october 19. there will be some improvement thereafter, until about the 22nd, and again october 25 to 30. severe geomagnetic disturbances can be expected again in the first few days of november. these will be most troublesome in the northern tier of states and in canada.

there were no visible sunspots reported for the week of october 3 through 9 ar

I have been reading alot lately in this notes file about all the problems people are having with there new Ham gear. well i had been planning to purchase some new gear but am now having secound thoughts.

Should I purchase new gear or just keep my Hallicrafters which have been working fine for me. Sounds to me like the old stuff is still more reliable than the new and easier to fix also.

I second the butternut vertical....i worked 5bwas, dxcc (mixed, ssb,
and cw) with mixed to 175 endorsement, WAC, and did well in several
contests...using the darn antenna from an apartment patio, with NO
ground wires.....I have heard people using them with ground planes,
and their stories are even more successful.

A couple of weeks ago, Gareth Howell had a note here asking for help with amateur radio emergency procedures. I have some documents I believe will fill his need. Unfortunately, no address for mailing was included, no amateur call was given, and Gareth said he only gets into the net occasionally.

If anyone knows how I can get in touch with him (or if you are reading this, Gareth), please send me the information I need. Many thanks and 73.

Having been QRT for over 15 years, I'm planning to (maybe) get active again. The first thing I'll have to get is a decent radio. I don't have a fortune to invest, and have more or less narrowed down my choice to an IC-735. Does anyone have any practical experience with it? I'm also interested in how the 1200 Bd serial port works, the local Icom dealer here (in Munich, Germany) couldn't shed any light on this. My assumption is that you should be able to control the rig similarly to an FT-757.

Or does anyone have any other suggestions? Rigs in a similar price class (at least here) would be TS-430, IC-745 and FT-757. What I need is a medium price (<$1000), preferably computer control (locks out TS-430 and IC-745), good receiver (I live close to a lot of strong AM/SW transmitters), full BK (I'm planning to get into RTTY, AMTOR, packet etc.).

73 de Ora, x-OH4QG, OH2TA, hopefully soon DL???

Listening to shortwave utility stations, or "utes", is a fascinating pastime. Although a general coverage receiver is usually required, one can get a taste of the action using ordinary amateur gear.

The 20 meter band coverage on many "amateur band only" transceivers extends to 14.500 MHz, and many non-amateur stations can be heard in the 14.4 - 14.5 MHz region. Although most transmissions are of the Spanish language "smuggler-bootlegger" variety, the following stations have been identified:

14.4540 CLP33_____Cuba: Cuban embassy, test msg, cw 10/15/85 @ 1838Z
[Addis Ababa, Ethiopia] (B. Parnass)

14.4550 call?_____US: NASA, Nationwide Tracking Net
[location?] (magazines)

NA4XAR____US: NASA, barge Orion calling NASA barge Poseiden during landing of Space Shuttle Atlantis on its first military mission, usb, 10/7/85 @ 1715Z
[location?] (B. Parnass)

P8W_______US: Navy, anti-drug smuggling network of aircraft and maritime stations, one station reported it boarded and seized a 60' small craft "by authority of Home Base", net seemed to be watching boats in an undetermined area, only tactical calls used, usb, 4/17/85

[location?] (B. Parnass)

14.4577 CIW62_____Canada: Canadian Forces Amateur Radio Network, phone pat
ch with CIS91 and CIS91B, usb
[location?] (B. Parnass)

14.4600 Y7L36_____East Germany: embassy, cw
[Havana] (B. Parnass)

14.4655 KCC97_____US: FAA, scene of accident and command & control net, us
b
[Diamondhead, HI] (govt recds)

KCD72_____US: FAA, scene of accident and command & control net, us
b
[Guam] (govt recds)

KDM48_____US: FAA, scene of accident and command & control net, us
b
[Pago Pago, American Samoa] (govt recds)

My own observations on newer ham gear and reliability are that ICOM seems
to have more problems than Kenwood. In our area, there are a LOT of Kenwood
users (430, 830, 930, 2500, and R-1000). One Kenwood
problem I recall locally is the early 2500's had a problem with the LCD
display "washing out". Other than that, one owner of a R-1000 receiver
had to have a small transformer replaced in the DC-DC converter that powers
the display and develops the negative AGC bias. That was in one of about

a dozen R-1000's that are around here.

I have not heard of any problems with any of the Kenwood H-F gear, and there is plenty of it in our area. I heard that early 930's had some problems but later ones were OK. I have a 2500, two R-1000's, the last 450MHz xtal controlled transciever Kenwood made, and a 8 month old 930S. So far the only problem I had was a cold solder in the 450 rig (located with the naked eye).

I have heard of quite a few people having to send their NEW ICOM rigs back.

A friend of mine, Jack Carroll, AB1Z, has written a paper called "Calling In The Hams: A Manual for Public Safety Officials and Public Event Organizers" -- or something approximating that title. Information on obtaining a copy is available from Jack at 275 Evergreen St., Bedford, MA 01730. He may ask for cost of copying and postage if he gets inundated with requests.

Incidentally, I have found that people recognize the term "ham radio" as something different than CB, whereas the seemingly more dignified "Amateur Radio" is more often confused with CB or perhaps pirate broadcasting. I was pleased to note that the newscasters IMMEDIATELY mentioned ham radio as a possible link to Mexico City after the recent earthquake. We are getting some serious recognition these days, usually under the name "ham radio".

A final plug: All you hams out there in Net-land please consider your responsibility to do at least a little public service work from time to time. I used to think helping with parades and boat races was silly, but I have become convinced that (a) it is good PR to preserve our special treatment with regard to spectrum space and (b) it is the best way to shake out the bugs and learn what works and what the problems are in field operations. It's a darn good idea to do your learning when your help is OPTIONAL rather

than when lives hang in the balance and seconds count. Besides, it's fun
to get out and do these things. My advice is: unless you are medically unable
to help out, you should try to participate in AT LEAST ONE public service
operation per year. That's not much to ask of you in return for our precious
spectrum allocations.

73,
John S., W3IKG

I have a friend in India who is a ham-radio enthusiast and I
wanted to find out what it takes to start communicating with
him over ham-radio.

Does anybody know:
1) Is it possible to communicate with India over ham ? I'm
   on the west coast of the U.S. near San Francisco.
2) What kind of equipment would I require to establish a
   reliable link ?
3) What does it take to get started ?

Thanks in advance!

Jayaram Kalpathy. ucbvax!amdcad!jayaram

I received my new Heathkit catalog today, in which there appeared a new
product: a fairly low-cost VLF converter kit.

I would appreciate references/suggestions as to a suitable receiving antenna
for VLF (10-500 KHz). I understand that loop antennas are popular.

Thanks! Bruce (K1FFX)

Almost as irritating as TVRipOff is the letter group <alot> which
popped up on the screen twice today. Check it out. There is no
such word in English.

Spelling isn't noticed on A3/F3, and it has always been clobbered
on cw. But with the growing use of the printed word on Amateur
Radio these days, spelling becomes more important.

Problems with electronic equipment are not new or confined to any one manufacturer. Frequently I find that problems become bad with a rig when the manufacturer takes short cuts and lowers the safety factors for parts to near zero to reduce costs and increase profits. Designers are always under pressure to keep costs down. Afterall, why use 40 amp diodes in a power supply that only provides 25 amps when 25 amp diodes are much cheaper.

That attitude has always plagued some ham radio manufacturers, even in years past (I remember some Eicho gear very well). The quality of any given manufacturer's gear will change with time, e.g. when I first got my lisense, Heathkits were top quality, state of the art. But in the 70's, they had severe problems with their top price rigs.

If you have a rig that does what you want and works fine - why get rid of it?

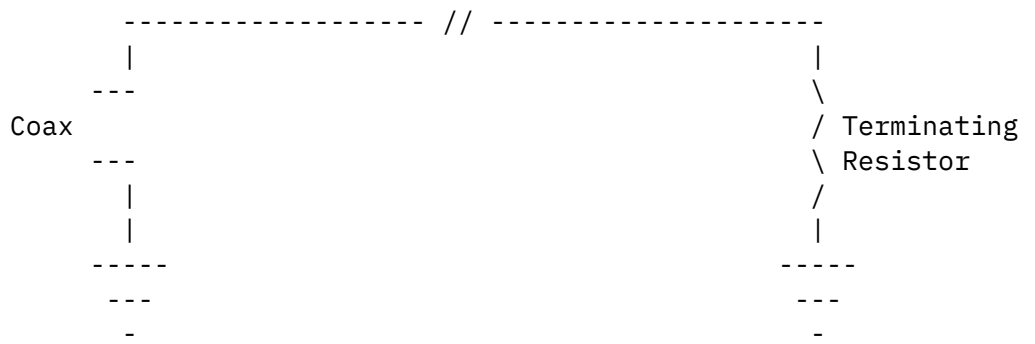
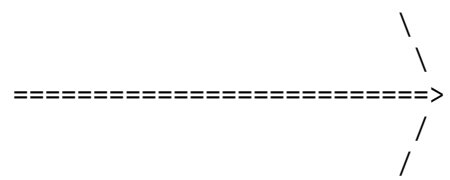
A Beverage antenna (named after a person, not a soft drink) is a directional receiving antenna. In it's simplest form it looks like this:



It's input impedance is usually around 300-500 ohms, so a 4:1 transformer is often used to connect to the coax. The wire is not very high; 3 to 10 feet is typical. A good beverage is long. A half wavelength is considered short, a wavelength is probably about the minimum where it is worthwhile to install one. I know of some beverages for 80 and 160 which are 1500 feet long or more!

The directivity is in the direction of the resistor. For the antenna pictured above, it is like this:



The resistor is usually about 470 ohms, although the exact value for best front to back depends on height, length, and ground conductivity. Some people use a potentiometer and adjust it for best results.

The antenna has loss as compared to a dipole, so it is never used as a transmitting antenna. Many radios require an external preamp when used with a beverage. Because the directivity of the beverage cuts down on the noise (remember, for receiving it's not signal strength, but signal to noise ratio that's important) it is possible to copy signals on a beverage which cannot be heard on a dipole or vertical.

Beverages are seldom used above 40 meters, since stations big enough to justify beverages have directive antennas on the higher bands. Even on 40 meters, they are not tremendously popular. But on 80 and 160, I have not heard anything which works as well.

There are people who use unterminated beverages, which are bidirectional, and there are designs for 2 wire beverages where the directivity is steerable. But when most people refer to a beverage, they are talking about the simple 1 wire terminated antenna.

I have been receiving newspaper articles and other dope on ELF from friends in Michigan for some time. For those that may not be aware of it, The Navy has this BIG transmitter/antenna thing covering many acres of ground to send data to subs. The last I heard, the site was commissioned and is on the air. Its center frequency is 76Hz and uses low speed frequency shift modulation swinging between 72 and 80 Hz.

Obviously, the transmissions are encrypted, but is anyone curious enough about it to attempt to receive it? I was thinking that a "TRF" type receiver would not be at all difficult to build but that the biggest difficulty would be rejecting 60Hz.

I have always been attracted to the idea of playing around on frequencies below 10kHz (where the FCC doesn't care) for short range local communications. I have been on 1750 meters and managed to be heard a mile or so away (with a legal transmitted signal level) using a very innefficient vertical antenna).

I have also thought about trying carrier current transmission on the power line for controlling my 2 meter repeater, a mile away.

Has anyone else messed around with low frequency stuff?

Summary: Three out of five rigs back to the factory is poor quality control

In article <868@decwrl.UUCP> daemon@decwrl.UUCP (The devil himself) writes:
>Regarding the purchase of new equipment and reliability of same:
>
>.............. . Its
>unlikely that a transistor or IC will fail in them. But when they do, it's
>back to the factory.
>............... Many of the repairs are glitches that appear
>during the first few days or weeks of operation. Here's some history on my
>gear:
>
   (Summary. Three of five rigs had to go back to the factory. Icom
    was pretty decent about warranty, etc.)

I personally think it should be extremely rare for a rig to have to go back to the factory (really a repair station, since the factory was most likely in Japan). How often does a GE microprocessor controlled clock radio have to "go back to the factory", even the ones made in Malaysia. They are pretty sophisticated, and the problems which seem to happen with these ham rigs seem to have a lot in common with them (I don't see a lot of problems reported with the RF parts of the transmitter circuits.)

>All my problems were caused by defective parts that could only have been
>picked up after realtime use. I doubt if Icom does 100% reliability testing
>on their assembly lines.

I still call this poor quality control. I doubt that GE (I am using this generic ly) does 100% reliability testing on their clock radios either, but 3 of five don't have to "go back to the factory". My own rigs: Heathkit SB-101, about 20 years old. Heathkit HW-12 75 meter single bander, even older. Kenwood

TR-7400A 2 meter rig, pushing age 10, the light bulb has burned out in the S-meter. Kenwood TH-21AT hand held, 2 weeks old, crossing my fingers. None of these has ever been "back to the factory". I have been coveting a new HF rig (such as Icom 735) but all this "back to the factory" stuff is causing me second thoughts.

     We are trying to find an article we saw about a VHF amplifier.
It had interchangeable cavities, which allowed it to easily be put
on different bands. It covered 50, 144, and 220 MHz. (? not
exactly sure of this) It used one power amplifier tube. If you
recall this design, please tell me where it is.

     Thank you very much.

I've long been a fan of Radio Canada International's program
SWL Digest. I used to like to listen 0300 Monday on 5960 kHz but for the last
several weeks there has been strong and rather strange interference in
this time slot (the French broadcast at 0200 generally comes in
loud and clear). Has anyone else noticed this? If yes, do you
know what's causing the interference? And are there other broadcasts
of SWL Digest dependably receivable in northeast US? The parallel
frequency at 0300 Monday, 9755 kHz, is not so dependable...

Thanks --

I am interested in setting up my ICOM IC22S on 145.01 mhz. The problem is that
the phase locked loop goes west below 145.5 mhz. Has anyone run an IC22S as
low as 145.01, or can someone point me to a reference (QST, etc.) with
info on moving the PLL down.

Please respond via mail -----> {allegra,seismo}!rochester!kodak!williams

    Since the phone stuff is deregulated, it seems that there must be a
standardization of several of the telephone functions. My questi85 15:39:09 GMT

Since there has been a suggestion for a listing of packet radio operators by state I thought I would help out by providing a list of operators in New York. Here they are;

Utica-Rome area

AC2I	RICHARD	CAMDEN
WA2BBE	GEN	ILION
KD2HM	OWEN	JOHNSTOWN
WA2AZA	?	UTICA
WA2YNS	?	UTICA
KD2EE	?	UTICA
KA2TSC	JOAN	UTICA
KA2GVI	BILL	UTICA
KA2GVI-1	(DIGIPTR)	
KA2GVI-2	(DIGIPTR)	

SYRACUSE AREA

NA2C	JOHN	SYRACUSE	KA1TY	GEORGE	N.SYRACUSE
N2GB	STEVE	SYRACUSE	AE2K	GEORGE	LIVERPOOL
KA2QJO	RICK	FAYITVILLE	N2DI	GARY	SYRACUSE
N2ACQ	MICK	OSWEGO	KA2ETW	VICTOR	SYRACUSE
WB2WHE	HENRY	SYRACUSE	WB2PIF	HANS	SYRACUSE
K2QCX	TOM	CLAY	KA2CIA	BOB	SYLVAN BEACH
N2AGO	GEORGE	CLEVLAND	WB2QFE	??	OSWEGO
KD2A	KRIS	WATERTOWN			

BINGHAMTON AREA

WA2AAQ	??	ENDICOTT	N2HR	??	JOHNSON CITY
NE2W	ED	BINGHAMTON	WB2LRO	??	OTEGO
WA2MSU	??	ONEONTA	KC2M	??	ONEONTA
WA3WKA	??	PORT DICKENSON	W2OW	(DIGIPTR)	

SOUTHERN N.Y.

WB2EMS	KEVIN	ITHACA	K2VD	MITCH	ITHACA
WB2NVU	??	ITHACA	WA3PWX	ALAN	CANDOR
W2IKF	PAUL	NICHOLS			

ROCHESTER

WB2NBU	DICK	N2GH	DAVE	W2DUC	FRED	KA2ASL	WALT
N2DWL	DAVE	K2YNW	BOB	N2AMK	FRANK	K2PPO	NORM
N2BNE	JOHN	N2EKR	BILL	WA2AAZ (DIGIPTR)			

BUFFALO

W2EUP	GIL	W2ICZ	OLE SYD	KA2OQZ	DAVE	K2NV	TONY
WB2SIB	JACK	K2IMF	DON	KD2FH	JACK	KC2UK	STEVE
KA2VTX	JIM	KA2VTY	DEB	WA2AIV	DON	W2FEY	RICHARD

OTHER (EASTERN N.Y.)

W2DTH	BILL	SCHENECTADY
WB2WHD	??	SCHENECTADY
W2LGF	RUEBEN	LAKE GEORGE
W2IDI	BILL	GLENS FALLS

  This list came from a (somewhat) local packet radio newsletter. Therefore, I can't be 100% certain about the status of all those listed but it should be a good reference for anyone needing information. Personally, I think this information could be very useful and I hope to see lists from other states.

Does anybody have any information on the upcoming German ham activity from space?

Rumor has it that they will be operating up link on 70cm and down link on 2m F.M., with possible activity on 10m. I have not seen any of this in print though.

Yes! I agree. We all worked for our licenses to communicate with each other not passively easedrop.

Ask your self if you would like someone else listening in on your conversations regardless wether the easedropper knew you or not.

Let's drop this issue and move on to other things.

Case in point... F.C.C. agrees that local government may not zone antennas out. I've been waiting for a decision on this for a while. That ruling is cause to celebrate. Of course, it's got to go thru the Supreme Court before it's offi-cial!

Can someone tell me where I can read an article on this subject?

Also, the FCC isn't cheap. Looks like the $200,000,000,000 deficit will hit
$300,000,000,000 in just a few years.   Really, see todays Wall Street Jorunal.
Thats only a few hundred thousand per family.
Then there is the un-funded debt; Social Security and Military Pensions.
I've seen government figures indicating it to be about 10 times as large.
Looks like soon the USA will be yet another courpse of a country.

If you need Kergulen (FT8X, formerly FB8X) now is a good time to get it.
FT8XA was on 7007 last night (26 Sept) at around 0235Z.
He is a better CW operator than FT8XB, who was on 40 meters
on 21 and 22 Sept.

There has also been a lot of pacific activity in the mornings on
40 meters, around 1100Z. Stations heard/worked include KX6DS, H44IA,
ZL7UW (Chatham), FK8FF, and VK9NM/LH (Lord Howe).

Also, N7ET/DU2 was heard on 7008 working Europeans. He was too weak to
work in Massachusetts, though.

There's also been some Asian activity in the evenings, with UA0BCV
and HZ1HZ coming through between 01:30 and 02:00Z.

As for Africa, the only interesting thing I've heard lately (besides
DL0MAR/9G) was 3V8AL, who was running Europe on 7001 at 21:15Z. I
was able to break the pile-up, and so was K1MEM. He then started to
listen for non-Europe, but I didn't hang around to see how much stuff
he worked.

DL0MAR/9G has been on 14026 at 17:30 to about 19:00, weak into the
U.S. but easily workable. After 19:00 or so he goes to 40 meters,
and tries 80 occasionally at U.S. sunset.

OE7RKH/YK is still active. He's been heard on 20 and 40 meters. He
sends error-free at 55 WPM, quite the CW op. I've worked him on 20,
40, and 80 meters; he has a good signal on all three bands.

Does anyone know what the pile-up on 7005 at 1100Z this morning
(26 Sept) was? There were a lot of JA's and some VK's calling,
but there was too much echo and the station they were calling was
real weak. I only heard one U.S. station calling.

          Paul Young, K1XM

I read a few days ago on this net that the 30 day waiting period is now gone.
Is this true? Is it in effect now? Does that mean I can just keep taking the
general code test over and over until I get lucky?

In this area there is a set of magic numbers that vary from exchange to
exchange. The deal is you dial XXX-NNNN where XXX is the magic number
and NNNN is the last four digits of your telephone number. You then get
a dial tone back. Flash the switchhook and you get a medium pitched tone,
hang up and the phone will ring.

Interesting side effect. When I was testing an answering machine, I was doing the ringback thing alot. After a whole evening of doing this, my phone suddenly got flagged "out of order" and I couldn't use it until the next day when someone at the co reset the line (they still sent someone out to the house).

Hr DX Bulletin Nr 37 From ARRL Headquarters
Newington CT September 19, 1985, Edited by K1BC
To All Radio Amateurs BT

Thanks to KB1BE and the Connecticut DX Association for the following DX information.

ARRL DXCC desk. The ARRL awards committee met on September 17 to consider the country status of the Pribilof Islands. The matter was referred to the awards committee by the DX Advisory Committee which had recommended addition to the list by a 9 to 7 vote. After many hours of studying the voluminous documentation and two hours of in person deliberation, the awards committee unanimously voted, 7 to 0 that the Pribilof Islands NOT be added to the DXCC countries list.

Comoros: Guido, PA0GMM is expected to operate from Grand Comoro Island as D68DX September 17 to 24 and October 1 and 2. He will also run FH/PA0GMM from Mayotte September 26 to October 1. He plans to work 20 meter SSB and CW. QSL to his home call.

Chad: N7DF/TT8 is active on 20 and 40 meters, but will move to a new location September 24 and is expected to work 80 and 160 meters. QSL via K0HGW.

Western Samoa and Tokelaus: ZL1AMO, Ron, is expected to be at 5W1CW around October 12, and then Tokelaus as ZK3, which is a new prefix replacing ZN7.

Papua New Guinea: Jim Smith, P29JS is using P29PNG to help celebrate the independence anniversary of the island. Look for him on 14220 KHz SSB at 0600 UTC and 3795 to 3800 KHz around 1130 to 1200 UTC.

St Martin and St Marteen: Joe, W3HNK, is expected to be at both French FS and Dutch PJ7 September 26 to October 2.

Kermadec: ZL4OY signing ZN8OY to start operations late this month through December 31.

Macao: XX9SP will be operated by KS9P from September 22 to 28.

Heard Island Look for VK2BCC as VK0CC beginning at the end of September. AR

The ARRL Letter is published bi-weekly by the Information Services Department of the American Radio Relay League, 225 Main St., Newington, CT, 06111; (203) 666-1541. Larry E. Price, W4RA, President; David Sumner, K1ZZ, Executive Vice President; Dave Newkirk, AK7M, Editor; Debra Chapor, Circulation Manager.

Information from The ARRL Letter may be reproduced in whole or part in any form including photoreproduction and electronic databanks, providing credit is given to The ARRL Letter and to the American Radio Relay League.

The ARRL Letter is available in printed form from ARRL. Subscriptions, limited to ARRL Members, are $19.50 (U.S. funds) per year for First-Class Mailing to the U.S., Canada, and Mexico. Overseas air mail subscriptions are available at $31 (U.S. funds) per year. Sample copies are available for an s.a.s.e.

In this issue:

o HAMS IN SPACE AGAIN

o FCC ON RADAR DETECTORS

o 902-928 MHz OPENING IMMINENT

o ...and much more!

FLASH! HAMS IN SPACE AGAIN -- NEXT MONTH!

In October, the Federal Republic of Germany will have the first scientific manned space mission of her own: the D1 mission. German science astronauts Dr. Ernst Messerschmid, DG2KM, and Dr. Reinhard Furrer, DD6CF, will carry out experiments on board the Spacelab, carried into orbit by NASA's Space Shuttle Columbia. They'll also operate an Amateur Radio station aboard Columbia -- DP0/SL.

During this Spacelab mission, scheduled to last seven days, startup of Amateur Radio activity is planned for mission day 3, continuing until about 12 hours before touchdown -- this means a stretch of as many as five days during which DG2KM and DD6CF may activate DP0/SL during their free time. As a rough estimation, six shuttle passes, each offering a maximum of 12 minutes of possible contact time, may be expected per day.

DP0/SL's ham-in-space activity will be focused on Europe -- but astronaut-amateurs Messerschmid and Furrer intend to to attempt contacts with other parts of the world, as far as mission parameters and spacecraft flight attitude (among other factors) may permit.

During DP0/SL's operating stint in the sky, calls of responding ground stations will be recorded on tape for post-mission evaluation -- to be confirmed by the Deutscher Amateur Radio Club (DARC) with special QSL cards.

When DD6CF and DG2KM are unable to undertake voice communication via DP0/SL, their rig may be operated as a recording beacon: an automatic CQ would be transmitted, followed by a one-minute listening period during which responses would be recorded on tape, with this cycle automatically repeated. Callsigns identified on this tape will also be confirmed by DARC. The

DP0/SL transceiver may also be operated as a normal beacon: continuous transmission with callsign inserted, but without receiving periods. This mode may be used for VHF propagation measurements.

The Rig Itself

The DP0/SL transceiver is a special development, designed and constructed by BOSCH/Germany according to the D1 Mission specifications, using components from BOSCH's mobile transceiver program. It contains a built-in microcassette recorder. RF power output of the rig is 10 watts; this is reduced to one watt for automatic (beacon) operation. Frequency coverage is 144 to 146 MHz, using F3E (FM voice) and F2A (FM Morse) emissions.

DP0/SL is equipped to receive in the band 430 to 440 MHz. Receiver sensitivity for a 12dB S+N/N ratio is 0.45 microvolts.

Selection of operating frequencies is made from ROM, programmed for 4 VHF transmitting frequencies and 6 UHF receiving frequencies on 25 kHz channel spacing.

And the Frequencies Are...

Channel	Downlink	Uplink
0/	145.450 MHz	437.125 MHz
1	145.475 MHz	437.175 MHz
2	145.550 MHz	437.225 MHz
3	145.575 MHz	437.275 MHz
4	---	437.325 MHz
5	---	437.375 MHz

Ground stations transmit on the uplink since DP0/SL listens there; ground stations listen on the downlink, since DP0/SL transmits there. Uplink and downlink channels may be "mixed and matched" -- for example, downlink Ch 2 (145.550 MHz) might be paired with uplink Ch 1 (437.175 MHz), the resultant pair being termed "2/1."

It's recommended that circularly polarized antennas, adjustable in azimuth and elevation, be used. Maximum tracking velocity to follow Columbia's orbit: approximately 1.5 degrees per second. At least for receiving, manual steering of the antennas is sufficient, since only low-gain antennas (3dB gain) are required to receive signals from DP0/SL.

An effective radiated power (EIRP) of 20dBW is recommended for contacts with Spacelab. This means, for instance, that a 70-cm transmitter with a power output of 10 watts, combined with an antenna providing 10dB gain, would be a good choice.

How DP0/SL May Operate

Astronauts Messerschmid and Furrer may use any of the following operating modes:

1) Ham rig "OFF"
2) Beacon operation with inserted

callsign, no receive

3) Beacon operation with automatic recording of incoming calls. In this mode, the transceiver transmits a CQ in Morse (F2A): "CQ DE DP0/SL RECORD ON TAPE K", followed by one minute of receiving time with automatic recording of calls. Responses to DP0/SL during such operation must be made using F3E (FM voice)

4) Two-way voice QSO operation using F3E

The normal channel pair will be 3/3 (145.575 MHz downlink, 437.275 MHz uplink). In the event of heavy pileups, the astronauts will change their receiving frequency without notice. In such cases, terrestrial stations will have to choose one of six uplink frequencies with equal likelihood of being heard -- reducing the pileup density for the astronauts by a factor of six.

More Information on DP0/SL

At this writing, German stations DF0/VR, DF0/LRK, DK0/UB and DK0/EK will issue daily information on the mission using 2 and 80 meters, but no real-time information service is in place outside Europe. A 20-meter service is a possibility. Closer to home for most ARRL members, W1AW and The ARRL Letter will provide further details as they become available. (tnx DARC)

902-928 MHz BAND OPENING IMMINENT

Remember -- we've got it as of 0001 UTC September 28, 1985. It's available to all radio amateurs under FCC jurisdiction in ITU Region 2 holding Technician class licenses and above. Amateur use of the band must proceed on a secondary, non-interference basis; we must not interfere with and must accept interference from the Fixed and Radiolocation Services, and industrial, medical and scientific (ISM) devices there.

An in-depth report on the how, what and why of the 902-928 MHz band appears in October QST. But now hear this, especially amateurs in Colorado and Wyoming: "In the 902-928 MHz band, amateur radio stations shall not operate within the States of Colorado and Wyoming, bounded by the areas of latitude 39 degrees to 42 degrees North, and longitude 103 degrees West to 108 degrees West. The band is allocated on a secondary basis to the amateur service subject to not causing harmful interference to the operations of Government stations authorized in this band or to Automatic Vehicle Monitoring (AVM) systems. Stations in the amateur service must tolerate any interference from the operations of industrial, scientific and medical (ISM) devices, AVM systems and the operations of Government stations authorized in this band" -- this the text of added Limitation 14 to Section

97.7 of the FCC Rules, in addition to the restrictions on operation and output power imposed in and around the White Sands Missile Range for this band (see the Letter, August 15, 1985); otherwise, the usual restriction of 1500 watts PEP output power applies. Emissions authorized are N0/N, A1A, A2A, A2B, A3E, A3C, A3F, F1B, F2B, F3E, G3E, F3C, F3F, F8E and P0/N.

The interim 902-928 MHz band plan appears in the FCC Rule Book, the 1985-86 Repeater Directory and in the August 29 Letter.

One more thing. Among the ISM devices authorized for use in the band (at 915 MHz) are microwave ovens. This is a broad-as-a-barn-door hint that caution is needed if you're going to be getting close to radiated 902-928 MHz energy in your Amateur Radio pursuits. So -- be careful out there.

LAST CALL FOR 420-430 MHz ABOVE LINE A

We lose a little as we gain 902-928 MHz, as reported in the August 15 Letter: also at 0001 UTC, September 28, 1985, the 420-430 MHz segment is whisked out of the Amateur Service "above Line A." See December 1984 QST for a detailed description of the Line; October 1985 QST carries the story in detail, complete with a map showing the position of the Line.

COURT TOLD OF FCC'S INTEREST IN PRB-1

Federal preemption in amateur antenna and tower matters is of high interest to amateurs anywhere. But especially it is running high in Kentucky. The case of Thernes vs. City of Lakeside Park was to be heard September 19, 1985, in the U.S. Court of Appeals for the Sixth Circuit. The "fact pattern" of the case is as good as any to come along in years: the city denied Thernes' (WM4T) application for a tower simply because amateur towers were not on the list of permitted accessory uses. Thus, the case is a good example of why the Federal Government should establish some degree of preemption in such matters. If PRB-1 were to be successfully completed before the oral argument September 19, it is virtually certain that the amateur would prevail. Without any input from Washington, DC, however, an unfavorable judgment was almost guaranteed.

Energetic work by ARRL's General Counsel and its Washington Area Coordinator got results on August 20. In a letter to the U.S. Court of Appeals, Sixth Circuit, Cincinnati, FCC General Counsel Jack D. Smith referred to Case No. 84-6009, John Thernes v. City of Lakeside Park, Kentucky, et al.:

"This office is informed that the above-referenced case, calendared for oral argument on September 19, 1985, concerns municipal regulation of amateur radio antenna structures.

"The Federal Communications Commission presently has before it a request for declaratory ruling delineating the limitations of local zoning and other state regulatory authority over federally-licensed radio facilities, File Number PRB-1. The staff has completed its analysis of the comments, and it is anticipated that the Commission will take some action by the fall.

"You may wish to consider the pendency of this proceeding in

establishing the Court's own procedural timetable in Case No. 84-6009."

Aside from any effect it may have in the Thernes case, should positive action on PRB-1 be a cause for immediate celebration everywhere? Not necessarily. The preemption issue is a labyrinth, and variations in local law abound. How PRB-1 should be viewed at this point was perhaps best stated at Minute 27 of the ARRL Board's July meeting in Hartford: "It should be regarded as providing a useful legal tool, rather than a panacea to solve all problems."

FCC SAYS IT DOESN'T REGULATE SPEED-RADAR DETECTORS

In a Public Notice dated August 1, 1985, FCC reminds us that they're not in the radar-detector-regulation business:

"Traffic radars used by police to enforce highway speed limits are transmitters. As such, they are type-accepted and authorized by the FCC under Parts 2 and 90 of its rules. These rules permit any state or local government with an FCC license for its radio communications system to operate speed radars without getting separate licenses for them. The radar frequencies and number of units do not have to be shown on the license itself.

"FCC rules spell out how radars may be operated as transmitters but not how they may be used by police to measure vehicle speeds. The FCC has no jurisdiction over the calibration of radars or over the reliability of their readings.

"[The U.S. Department of Transpor-tation's National Highway Traffic Safety Administration (NHTSA) is the federal agency concerned with the enforcement of highway speed limits and with the operation of police radars as enforcement tools. For more information, write to NHTSA's Office of Enforcement and Emergency Services, 400 Seventh St., S.W., Washington DC 20590. Or call the state or local police department for information about how radar is used in a particular area.]

"Radar jammers are transmitters tuned to interfere with ('jam') a radar signal. The intentional use of jammers is considered 'malicious interference,' which is strictly prohibited by the Communications Act of 1934, as amended by FCC rules. Anyone using a jammer risks such penalties as losing any FCC licenses, paying a fine, or even facing criminal prosecution.

"Radar detectors are radio receivers popularly known for being tuned to receive police radar signals...[for the purpose of] warn[ing] motorists of radar 'traps' ahead of them. In this regard, the FCC regulations pertaining to receivers are limited in scope and, as currently drafted, do not address the subject of radar detectors. The use of radar detectors by members of the public, therefore, does not constitute in itself a violation of FCC rules. The FCC is aware that other agencies have addressed the subject of radar detectors, but the FCC has not, to date, and has no future plans to address the activities of these other agencies.

"In summary, the FCC regulates transmitters, but exercises only limited jurisdiction over receivers, with the subject of

radar detectors not being addressed in the FCC Rules. From a policy standpoint, the FCC favors authorizing the use of radio, including radars, to promote safety on the public highways and elsewhere."

[Editor's comment: note well the warning concerning the possible loss of any FCC licenses if you're cited for radar jamming. We understand, for instance, that this has already come up in cases of "pirate" broadcasters who were also licensed as radio amateurs. Understandably, FCC takes the position that being licensed to operate a transmitter in one service implies that you "know better" than to operate an illicit transmitter in another.

[In some instances, operation of a VHF or UHF transceiver in the vicinity of a police radar can result in erroneous estimations of vehicle speed. ARRL Hq. can provide a letter of assistance in such cases where police radar may have been at fault because of VHF/UHF interference. (If you were speeding, though, better 'fess up!)]

EXECUTIVE COMMITTEE DELIBERATES ON DOCKETS 85-215, 85-196, 85-231 -- AND PRB-2

The ARRL Board's Executive Committee met in Scottsdale, Arizona, on August 24, 1985. Consideration of the League's position in regulatory matters will result in the filing of comments in opposition to PR Docket 85-215, Auxiliary Operation; in the EC's view, auxiliary operations should be conducted only on frequencies above 220.5 MHz. The ARRL's position in PR Docket 85-196, "Maintenance of Question Pools in the Volunteer Examiner Program...," remains that FCC should retain maintenance of the examination pool and that only VECs should be permitted to design exams from questions in the pool. In General Docket 85-231, concerning field disturbance sensors at 54-72 and 76-88 MHz, ARRL will file in support of FCC's decision to disallow the devices in the 50-54 MHz band as requested by the original petitioner, Control Data Canada, Ltd. In PRB-2, a request for a waiver of amateur rules to allow use of Amateur Radio frequencies for newsgathering, Counsel was ordered to file comments opposing "in the strongest possible terms" the unwarranted intrusion of broadcasting into an amateur band.

Up to the minute news from the worlds of amateur radio, personal
computing and emerging electronics.  While no guarantee is made,
information is from sources we believe to be reliable.  May be
reproduced providing credit is given to The W5YI Report.
```

In this issue:

- National VEC Organization Formed
- Gathering News on the Ham Bands
- Ham Publishes Commodore Book
- AEC - Work-at-Home Association

: :

The W5YI Report, even though a VEC in all regions, has been given permission by the FCC to distribute license preparation materials as a convenience to applicants and VE's. All manuals contain ALL questions, answers and discussion why the answer is right! You can order the guides from The W5YI Report, PO Box 10101, Dallas, TX 75207. The following guides are available:

FCC-Novice Study Guide	$3.00 + $1.00 Postage
FCC-Novice Element 2 Test	$1.00 + $0.50 Postage
FCC-Tech/General Study Guide	$5.00 + $1.50 Postage
FCC-Advanced Study Guide	$5.00 + $1.50 Postage
FCC-Extra Class Study Guide	$5.00 + $1.50 Postage
FCC Part 97 Rules Book	$3.00 + $1.50 Postage

: :

Note: Would you like to become a Volunteer Examiner under The W5YI Report program? If so, please send a copy of your Extra Class license, the following statement, and an SASE to:

W5YI - VEC
PO Box 10101
Dallas, TX 75207

You will also receive a booklet on how the Volunteer Examination program operates and how to go about giving tests. A certificate (optional) is also available for $1.00. Details and accreditation materials will be sent to you within a two week period. Include the following statement with your VE request:

"I am a currently licensed Extra Class amateur radio operator and wish to be a Volunteer Examiner. I have never had my station or operator license revoked or suspended. I do not own a significant interest in nor am an employee of any company or entity engaged in making or distributing amateur radio equipment or license preparation materials. My age is at least 18 years old."

: :

Do you have Amateur Radio news to contribute to The W5YI Report? If so, please call (817) 461-6443 and leave a message on Fred's recorder!

: :

o National VEC Organization Formed

Should the fragmented amateur testing community be brought together under the guidance of a single umbrella organization? That was the question pondered by VEC representatives at a recently concluded FCC workshop held August 9th at the FCC's Gettysburg, PA, licensing facility. At present, we have some two dozen plus VEC ham test administrators.

The informal after hours meeting found that much duplication of effort exists among the VEC's. Each has their own test preparation system and a somewhat different program... even though their instructions from the FCC are the same. The collective feeling seemed to be that VEC's need to work together toward achieving uniform amateur radio operator testing and a system should be developed to provide for input from VE's and VEC's into the testing decision making process.

Many phone calls and a couple of weeks later, a national testing organization tentatively named the Council for Amateur Radio Examining (C.A.R.E.), has been formed. Already being considered are such things as mutually recognizing each others volunteer examiners, developing a common examination pool, establishing test standards, co-op printing and stockpiling of testing materials and cooperating in exam scheduling. C.A.R.E. will also serve as a national clearinghouse to gather and disseminate amateur radio testing information.

Membership in C.A.R.E. will be open to any FCC accredited VEC and to any individual volunteer examiners... even if the VEC is not a C.A.R.E member. Associate membership status will be open to anyone. Annual dues range from $25.00 for VEC's down to $5.00 for associate members.

Work on the C.A.R.E organization is continuing rapidly. The Board of Directors will be made up of each VEC member - each having one vote on C.A.R.E. policy. A Vice Director will be selected by the Director. A National VEC Net to discuss how amateur radio operator testing could be standardized now meets Sunday's at 14.173 MHz at 1700 Z.

Preliminary draft articles of C.A.R.E. incorporation in the State of Illinois have been prepared and forwarded to all VEC's for further comment and suggestions. Incorporation will be sought under IRS Code 501(c)3 which provides for non-profit incorporation for charitable, educational and scientific purposes.

The initial officers of the group will be:

Joe T. Ingram, Jr., K4OOV, President, Central Alabama VEC - Region 4.
Alex Magocsi, WB2MGB, First Vice President, Metroplex VEC - Region 2, soon to be a national VEC.
Frederick O. Maia, W5YI, Vice President, The W5YI Report VEC -

National VEC.
        James Georgias, W9JUG, Executive Vice President, Devry VEC - National VEC.
        Gordon Girton, W6NLG, Secretary/Treasurer, Sunnyvale VEC - Region 6 VEC.

These officers will serve until 1987. While the president will be the principal officer of the corporation, day-to-day operation of C.A.R.E. will be handled by Executive Vice President Jim Georgias, W9JUG, of the DeVry VEC. Joe Schroeder, W9JUV, has been asked to handle the public relations function of the group.

o News Gathering on Ham Spectrum

Should the FCC allow news gathering on amateur radio frequencies? Up until this point the Commission has ruled that this is an illegal (commercial) use of amateur spectrum. In the wake of a NPRM (Docket 85-188 4/15/85) that provides for land mobile - amateur radio service shared use of the 421-430 MHz band, this may be changing.

On August 13th, Lee Shoblom, President and General Manager of London Bridge Broadcasting, Inc., 2001 Industrial Blvd., Lake Havasu City, AZ 86403, filed a request with the FCC for waiver of the amateur rules to permit him to use amateur radio for news gathering for broadcast purposes.

Specifically, Mr. Shoblom requests that he be permitted to use amateur frequency 434 MHz for gathering news on matters of community interest and broadcast such news on his low power television station.

The FCC's Private Radio Bureau seeks comments on this filing and has assigned "File No. PRB-2" to the matter. "PRB" file numbers are something the FCC unofficially came up with to solicit information from the public. They are more or less similar to NOI's ... Notice of Inquiry which we don't seem to see too much of any more.

News gathering on amateur frequencies has some interesting ramifications. Will amateurs be allowed to participate? Can they be stopped if the licensee (broadcaster) approves it? Can non-type accepted ham gear be used when usually FCC approved communications equipment is required?

I can remember thirty years ago participating in the New England Weather Net on 80 meters. While commercial radio stations did not actively participate, they did listen - and broadcast - the weather the amateurs passed on. At least one television station gave credit to the weather network for their reports. It was cloudy as to whether the net existed to assist broadcasters - or to simply exchange reports among amateurs.

We were confused as to why it was OK to report bad weather directly to amateurs at the US weather burear via ham radio but not to amateur radio

operators at commerical stations. There seems to be a fine line between amateur and non-amateur public service.

A good use of amateur spectrum might be to report traffic tie-ups and accidents to broadcast stations during rush hour traffic but it is not legal. But it is legal to report it to the police via phone patch.

Broadcasters have trouble understanding the difference. Some maintain that the government has no power to control what is said on the air waves... any air waves. The difference, of course, is that the Part 97.110 rules allow emergency... but not routine... business communications on the ham bands. Broadcasters do not handle emergencies... they only report them.

o Ham Publishes Commodore/Ham Book

If you are a ham and have a Commodore home computer, you might look into a new book entitled "The Commodore Ham's Companion."

Written by Jim Grubbs, K9EI, of Springfield, IL, the 160-page paperback book contains over 80 sources for Commodore amateur radio software and hardware... and a bibliography of over 60 magazine articles and reviews about using Commodore machines in the ham shack.

Jim claims that Commodore machines are the easiest to interface with amateur radio. He concentrates on the VIC-20 and the C-64. The chapter on "How to use your Commodore computer to join the packet radio revolution" is worth the price of the book alone. Jim talks about his packet lashup to his Dad, W9DXA, and brother, Jon, WB9YJC. Completely up to date , he also mentioned the TAPR TNC-2 ($185) that has just been released! (Book was published in August.)

Self-published by QSKY Publishing, (PO Box 3042, Springfield, IL 62708), "The Commodore Ham's Companion" Is $15.95 plus $2.50 first class shipping/handling. (VISA/MC accepted). Jim, an active ham since age 11, holds Satellite Worked All States certificate #16.

o Independent Computer Cottagers

Do you have some sort of computer linked business "on the side"... maybe even full time... that you do from your home? If so, you might want to consider being a member of AEC... the Association of Electronic Cottagers formed in January 1985.

Formed by Paul and Sarah Edwards of (677 Canyon Drive), Sierra Madre, California (91024), AEC is designed to support the growing number of people who work from their home with personal computers.

The Association of Electronic Cottagers is partly a support group for

the cottage industries made possible using personal computers and partly a rights watchdog for home workers.

Members of AEC can obtain marketing assistance, business consultation and other services... also access up-to-the-minute news affecting their interests through a monthly newsletter, an online hotline, bulletin boards, electronic conferences and private databases available through the CompuServe Information Service.

AEC evolved out of an international computer network... the Work-At-Home special interest group (SIG) of CompuServe, an interactive database for computer users. The Edwards' began this SIG because they wanted to meet other entrepreneurs and believed others had the same need.

Labor unions see working at home and telecommuting as a threat. Local bureaucrats, using zoning laws, have put some home computer workers out of business. AEC has put together an Electronic Bill of Rights which, among other things, asks that legislatures make no laws prohibiting freedom to work in one's home... when that work does not interfere with neighbor's enjoyment of their own homes and communities.

The Edwards' are the authors of several books on working from home with a personal computer. Paul is an attorney... Sarah holds a Masters degree in Social Work. Their 18-year old son is an engineering student at UCLA.

Intensity matters. You *emit* microwaves, remember, as does any warm object.

Not true! You are referring to the sectoion 605 of the Communications Act.
Common carriers are protected (by different rules) from interception. Those

rules have been used to prosecute (for example) MDS HBO listeners.

As you in the East may know, the VHF bands were in very good shape up
and down the East coast this weekend. Apparently Saturday evening was good,
but I wasn't on. The following is my view of things from the Washington, D.C.
area.

Tropo conx were good, and improving when I listened just before 8 am Sunday
morning....

My 432 setup isn't very good; there were good contacts on that band as
well. For example K4CAW (NC) worked VE1UT in Nova Scotia.

All contacts on 144.2+- SSB unless noted

Time	Station	State	Grid	
29 September 1985				
1140Z	WB4NMA	GA	EM84	
1142Z	WS4F	GA	EM84	
1144Z	WB4TWX		EM94	
1147Z	W4HGM		EM84	
1206Z	W4OJK	NC	EM96	also worked on 432
Then I had to leave the house....				
2215Z	KB4CSE	SC	EM94	

2220Z WB2KHD GA EM83
2228Z K4AGV NC EM96
2240Z WA4VCC SC EM94
2248Z WA4NJP GA EM84
2256Z WB4EFZ SC EM94
2336Z KE6HA TN EM86
2350Z K5MA/1 MA FN41 W. Falmouth, MA
2356Z WQ4V SC EM95
2359Z AA4FS NC FM05
30 September 85
0012 WB2OTK SC EM84
0020 W9IP/2 NY FN24 Johnstown, NY
0025 K1WHS ME FN43
0028 WB2KMY NY FN31
0054 WB2RQC NY FN23

I know next to nothing about radios, but I just purchased a
really neat old radio and would appreciate any tips on how to
use it and maintain it.

Said radio stands about 3 feet tall and is housed in an art
deco style wooden cabinet. The radio will pick up local and
short wave stations, and police bands.

Does anyone know of a good introductory type book about this
type of radio. I would like to know more about them so I don't
wreck the marvelous old beast.

Received your mail ok here but for some reason can't get back to you
directly.

I was not aware that there was any 60 kHz signals from England. I believe
there is something on 50 kHz however (which I have never heard here).
I would think the tuned loop would reject that.

Thanks for the info on the manufacturer of the unit you have.

I believe that WWV or the NBS has something like 5 to 7 of the cesium

clocks in operation.

Thanks to all those that commented about the desire for DX info.
I received about 2 dozen direct comments. They were pretty evenly split
between suggesting that the info be posted on the net by each person
or, mailing the info to one person for posting later.

I would think that until/unless it gets out of hand, we should just start
by each person posting his own info. Anyone not wanting "DX INFO" can just
hit the "N" key....

I do not know how to reach you via usenet (is there some kind
of UNIX mail interface ????).

If you need to reach me and/or confer about HC8 trip I can be reached
via net.ham-radio or ihnp4!druxr!n2ic (if you know how to get to
ihnp4 !).

By the way, I have been running propagtion charts using the RSGB version
of Minimuf from HC8 to various spots. Verrrrry Interesting !
If you can send me a UNIX mail address, I will send you them.

73,
Steve London, N2IC

qst de k9eui
hr arrl bulletin nr 86 from arrl headquarters
newington ct september 30, 1985
to all radio amateurs bt

on october 8 the earth will pass through the orbit of comet
giacobini zinner, only 25 days after the comet has passed.
experts have estimated that this might repeat might produce
6000 to 10000 meteors per hour. the annual perseids meteor
shower produces about 40 to 60 per hour. packet radio offers
an excellent opportunity to collect data on the effect of
meteor showers on vhf communication.

it is suggested that from 0500 to 2100z on october 8, packet
stations call cq on frequencies of 28.0985, 50.65 and 145.09

mhz about every 10 seconds and send only the two letter two figure grid square of your location, optionally followed by the hour and minutes in zulu time if your setup can be programmed to do so. then monitor and save to disk all incoming cq transmissions if possible. if you wish to connect to another station, exchange grid squares. power levels of the order of 100 watts to the legal output limit are usually necessary for meteor scatter communication.

on 28.0985 mhz use direct frequency shift keying or frequency shift keying of audio tones via a single sideband transmitter. on 50.65 and 145.09 mhz use frequency shift keyed tones modulating a frequency modulated transmitter. all frequencies are center frequencies.

according to fcc rules, the above transmissions must be under operator, not automatic, control at all times. by comparison, unattended beacons in these bands are limited to 100 watts on the subbands of 28.2 to 28.3, 50.05 to 50.08 and 144.05 to 144.06 mhz.

listen for w1aw on 50.65 mhz.

please send reports to,

wake digital communications group c/o ed stephenson, ab4s 700 madison ave , cary nc 27511

a summary will be prepared for qst ar

qst de k9eui
hr crrl bulletin nr 23 from crrl headquarters
london ontario september 29, 1985
to all radio amateurs bt

doc made several important announcements at the rso crrl 1985 convention held in london, ontario this weekend. effective friday, september 27, canadian amateurs may,

use cw and phone, maximum legal power, on the entire 160 meter band, 1.8 to 2.0 mhz.

operate repeaters on the 29 mhz band.

use 6 mhz bandwidth fast scan television.

operatz slow scan television without a special endorsement.

also effective friday, september 27th, foreign amateurs from itu regions 1 and 3, operating under reciprocal agreements, may use the entire 2 meter band, 144 to 148 mhz.

doc declined to comment on restructuring of the amateur

service, which is likely to propose a canadian novice license, because the document was not in its final form.

doc did indicate its intention to proceed with the proposal for deregulation of mode sub bands, which would allow canadian amateurs to operate any mode, anywhere in their amateur bands, relying only on voluntary adherence to recommended band plans ar

qst de k9eui
hr propagation forecast bulletin nr 39 from arrl headquarters newington ct september 30, 1985
to all radio amateurs bt

with one day to go as this bulletin was prepared, the solar flux average for september is 69.6. this will not change significantly when the flux reading for the 30th is added. we will then have our first monthly average under 70 since july 1976, the start of cycle 21. the present calm spell began august 11, when a nine year low of 67 was recorded. the flux has been no higher than 73 since, and there have only been 3 of these. more important, there were 26 days under 70 in the past 2 months including one 66 and six at 67. several short lived sunspots appeared several times but the most recent visible spot activity of any consequence came in late july.

some solar emissions that cause fluctuations in the earths magnetic field and increased attenuation of hf signal levels in the higher latitudes cannot be seen in the conventional white light view of the sun. thus the sunspot record is not a completely reliable indicator for hf propagation prediction. the very erratic hf conditions of late september were typical,

with about 5 periods of 1 to 2 days each of very good and very bad propagation, following one another in rapid succession. there will be more of this in october, after some fairly consistent good times early in the month.

it is believed that the almost total absence of sunspots recently is a temporary phenomenon, probably not an indicator of an early end of cycle 21. the best 8 weeks of the year are at hand, in any case.

american sunspot numbers for september 19 through 25 were between 0 and 10 with a mean of 3.4 ar

Don't get tooooooo excited yet. HBO has announced the availability of
their home decoders by the end of 1985 at a price of $400. (Broadcasting
magazine, 30 Sept 85). If I remember correctly the monthly subscription
fee will be something like $12 for HBO OR   Cinemax, or $18 for both.
I'm sure I'm right about the purchase price, but may be somewhat low on
the monthly price.

Bob, W3OTC

VA-PKT.OCT

Revised September 29, 1985
By K4NGC

The following is a list of call signs and names of some Radio Amateurs in Virginia, known to be on Packet Radio. Also included are their primary digipeaters and PBBS mailboxes used, if known. A number of files covering different areas of the northeastern United States are available on a number of EASTNET Packet Bulletin Board Stations.

File Name	Area Covered	Maintained by @ Mailbox
MD-PKT.###	Maryland	K1HTV @ W3IWI
NY-PKT.###	New York	WA2RKN @ WA2RKN
NJ-PKT.###	New Jersey	N2DSY @ WA2SNA
PADE-PKT.###	Pa & Del.	K3TS @ WB2MNF
DCWV-PKT.###	DC & WVa.	K1HTV @ W3IWI
VA-PKT.###	Virginia	K4NGC @ W3IWI

Note: The "###" above refers to the month which the file was updated.

EAST-MAP.17
October 1, 1985
by K1HTV

The following is a graphic representation of Packet Radio links which are believed to exist on 145.010 MHz on the East coast of North America. The area covers from Canada to and including the state of North Carolina. Another file called SOUTHMAP.NNN covers the area from Virginia south to Florida. Included in these maps are digipeaters, Packet Bulletin Board Stations (PBBS), and home stations usually left on for digipeating. Stations running W0RLI compatible software for PBBSs, Mailboxes and/or gateways are indicated by the use of the "@" character preceeding the call sign. The primary routes used for mail forwarding in EASTNET are marked with asterisks (****) while other links are shown by either | \ or / as connecting characters. All "****" routes are presently on 145.010 . In the Baltimore/Washington area .050 is heavily used for local traffic. Links on 145.050 MHz in MD, WV and PA are connected on this map by (.) dots. 220 MHz trunk links will parallel 145.010 in the future.

To improve readability of this linking you might want to use colored felt tipped pens to outline the various linking paths. Those links which are marked with a question mark (?) indicate a link of unknown reliability. If you have any information concerning known reliability, unreliablity or non-existence of any links shown on this map please drop me a note. Send the info to me, K1HTV @ W3IWI, via one of the many auto-forwarding PBBSs or via the U.S. mail.

Help!

Can anyone point me in the right direction to obtaining information
(schematics, theory,etc) on large, electronic flash units? Any
book titles or other sources would be appreciated.

Thanks

I have just sent a copy of the Packet Radio East-Map and Virginia Packet
User Listing to all hams. It would be interesting to see if we could use
this system to exchange Maps and User Listings for the entire United
States. Because Packet at present time can not do it because of incomplete
links this could be a way of passing this needed information. How about it,
anyone interested.

This may not quite fit into the ham radio catagory, but
I found no info in net.audio or video and knowing the vast
pool of knowledge in ham-radio circles(!) I thought I`d try here.

Does anyone know where I can find out the scheme used for
stereo sound transmission on broadcast TV signals? Looking at
the signal it seems to be some kind of sub-carrier system, but
not (L+R) and (L-R) as in FM radio.

Thanks, Bob Atkins (KA1GT)

This morning, 3 October, was the first time we got any significant
long path openings in the morning. Several UL7's and UA9's were
coming through. Also 9V1TL was on, big USA pile-up, plenty of
people calling continuously. VK9NM/LH was also active, and has
been almost daily. He still had a good pile-up going, though.
And a VU was also coming through, although I don't remember the
callsign (VU2TEC?). All this was between 1130 and 1200Z, and all
the signals were coming from the South or Southwest. This was
from Massachusetts, of course.

I have a good friend here in San Diego, CA who makes a living
restoring and knowing a lot about old radios. He's a ham, too.
Suggest you call: Bill Gabb, K1BO, (619) 692-4321. I'm sure he
can recommend books that will help you. He can also give you
some idea of what your "baby" is worth if you give him the make
and model, etc. He's also a good source for tubes and other
hard-to-find parts. Tell him I sent you.

Some of those floor model radios are really hot receivers in that
they were made for people who lived in Upper Cornfield, Nebraska
and wanted to listen to WGN in Chicago and WNBC in New York;
likewise to BBC and Tokyo Rose. Have fun!

Some time last year there was some interest in the results of my project of rebuilding/modernizing an old Johnson Desk Kilowatt. The basic renovations were removing the screen and bias supplies and converting the RF deck to a grounded grid scheme. I also added 160 meter capability (which has affected 10 meters due to added stray capacities to the point where it will not function on 10). Since I also completely rebuilt the control/power circuitry, I basically started over except for the main layout of the RF deck.

Except for the 10 meter situation, results have met expectations and the unit performs well with the 100 watts drive from my 930S. Input matching is done with a low Q "T" network which replaced the old grid tank.

For 160 meters, a coil is switched in series with the original rotary inductor and 300 pf added across the plate tuning capacitor. This coil is shorted out but still connected to the circuit on the other bands. The proximity of this coil to the shield cover adds the unwanted stray capacitance to ground which affects the upper bands. If I can find a suitable DPDT switch, that problem should be taken care of.

Input power is about 950 watts (2500V at 380ma). On 160 thru 20 meters, output is 800 watts as measured on a Bird wattmeter. On 15 and 12 meters, the output is 600 watts.

If anyone has any questions, ask away. I would like to know if anyone else on the net (or anyone you know) has one of these

units.

The question concerns the formula given in the handbooks for determining the length of a half wave dipole.

The handbooks say that dipole length in free space is determined by the formula: 492/MHz = feet. End effects on wire antennas reduce this figure by 5% so that the common figure used is 468/MHz = feet.

Several friends and I have erected various antennas this year and have all independently arrived at the conclusion that 492 should be multiplied by

This was observed during the installation of at least 3 antennas (80, 40 and 12 meter dipoles) all at different locations, and all at various heights. In every case, it meant shortening an antenna that was cut to length with the handbook formula. It made no difference if a balun was used or not, except that higher frequency antennas (say 20 meters and up) often have to be slightly shorter if a balun is used since inductance adds to the electrical length.

If what we are seeing is real, where was the .95 factor derived from and why has it not been corrected?

qst de k9eui
hr dx bulletin nr 39 from arrl headquarters
newington ct october 3, 1985
to all radio amateurs bt

thanks to w1trc, k1xm and the southern new england dx association for the following dx information.

cyprus. zc4mr has b cyprus. zc4mr has been active on 3786 khz between 0300 and 0400z. he can also sometimes be found around 14225 khz at 1900z.

namibia. zs3e shows up on 7060 khz, listening on 7160 or 7198 khz, at 0545z, particularly on mondays.

guernsey. dale, k5mm, will operate gu0cia for one more week. he operates 160 through 20 meter cw only. he has been worked on 1834 khz between 0500 and 0600z. qsl via w7ni. also, a group of dutch amateurs will operate gu0/pa2fas on all bands 160 through 10 meters, both ssb and cw, from october 23 to 30.

rhodes. hal, sv0dv/9 is planning a visit to rhodes in a few weeks. he will operate on 80 and 40 meters. qsl to wb4tdh.

zaire. pa0gam will operate 9q5ma through october 10. he will be mainly on cw, 80 through 10 meters.

kerguelen. ft8xa is active on 40 cw between 0100 and 0200z.

mali. tz6fe, franz has been on 14227 khz at 2300. qsls go to dl4bc.

st. pierre. fp5hl has been active on 1833 khz at 0200z.

burundi. 9u5jm has been worked on 14183 khz around 2230z.

aland island. oh0rj was active over the weekend on 14175 khz
at 1400z.

liechtenstein. hb0/dk1dn has been worked on 3798 khz at 2300z

For Sale: Ham Radio Station and Oscilloscope

PRICE SLASHED!

Icom IC-720A transceiver with narrow CW filter
Icom PS-15 power supply
Icom IC-SM5 desk microphone
Icom hand-held microphone (not used for mobile operation)
AEA AMT-1 Rtty/Amtor computer interface
Astron RS-7A 12 volt dc power supply (for AMT-1)
Heath phone patch
Hustler vertical antenna (80, 40, 20, 15, 10 meters)
Heath IO-4105 oscilloscope (5 MHz, single trace)

The transceiver is in very good condition and has never been
used for mobile operation. The oscilloscope is in mint condition
because it has received practically no use since construction (it
was certified by Heath as in perfect working order). The AMT-1

will work with most microcomputers that have some kind of terminal
program for communicating with other computers.

I prefer to sell everything as a package for $1100.00 (I'll pay
the shipping), but will consider other offers.

Call me at 312-231-6054 (Mon - Fri, 8:30am - 4:30 pm CST) or
312-852-1271 (Mon - Fri, 5:30 pm - 10:00 pm CST, or all day on
weekends).

Don't hold your breath. The HBO scrambling experiments STILL are going
badly, and the technical problems with the scrambling system have yet
to be solved. It increasingly looks like other broadcasters may
decide NOT to use the same system as HBO unless the technical issues
can be worked out properly.

I have just recently received my Tech license, built a HW-5400 now at Heath
for further trouble shooting after I found numerous bad MOSFET's, and am
now in search of a suitable multiband HF antenna to get me started. To that
end I am considering some sort of trap vertical, so could someone please
give me some suggestions, comments, or advice on the HyGain 18AVT, Cushcraft
AV5, and Hustler 5BVT/6BVT. Which one would give the best overall operation
and freq. coverage. Any assistance would be appreciated.

73,

Jim Scott

>I guess that means several hundred people per family (to get to "a
>few hundred thousand per family").

Looks like you cought me; my mistake. $200 Billion is "just" the Deficit
for this year. I guess the funded debt then at $2 Trillion would be "just"
$10,000 / person. And of course as we all know (dont we?) the unfunded
debt is somewhere between 3 and 10 times the funded debt. You know good
old social in-security, milatary pensions, etc. I even heard a congressmen
today actually say something about the constitutional ammendment stoping
a Bidgit Deficit not being significant because all the really important
stuff isn't in the budget; well at least he was being a bit honest.
So if we optimisticly estimate a unfunded debt of say $10 to $20 Trillion
that would be JUST $50,000 to $100,000 per person.
I left my economic literature in storage, else I could give you the
offical actuarry figures.

Of course we have a congressive (sic alias: progressive) tax structure
that puts a significantly larger part of that burden on us UNIX hackers,
doctors, etc...

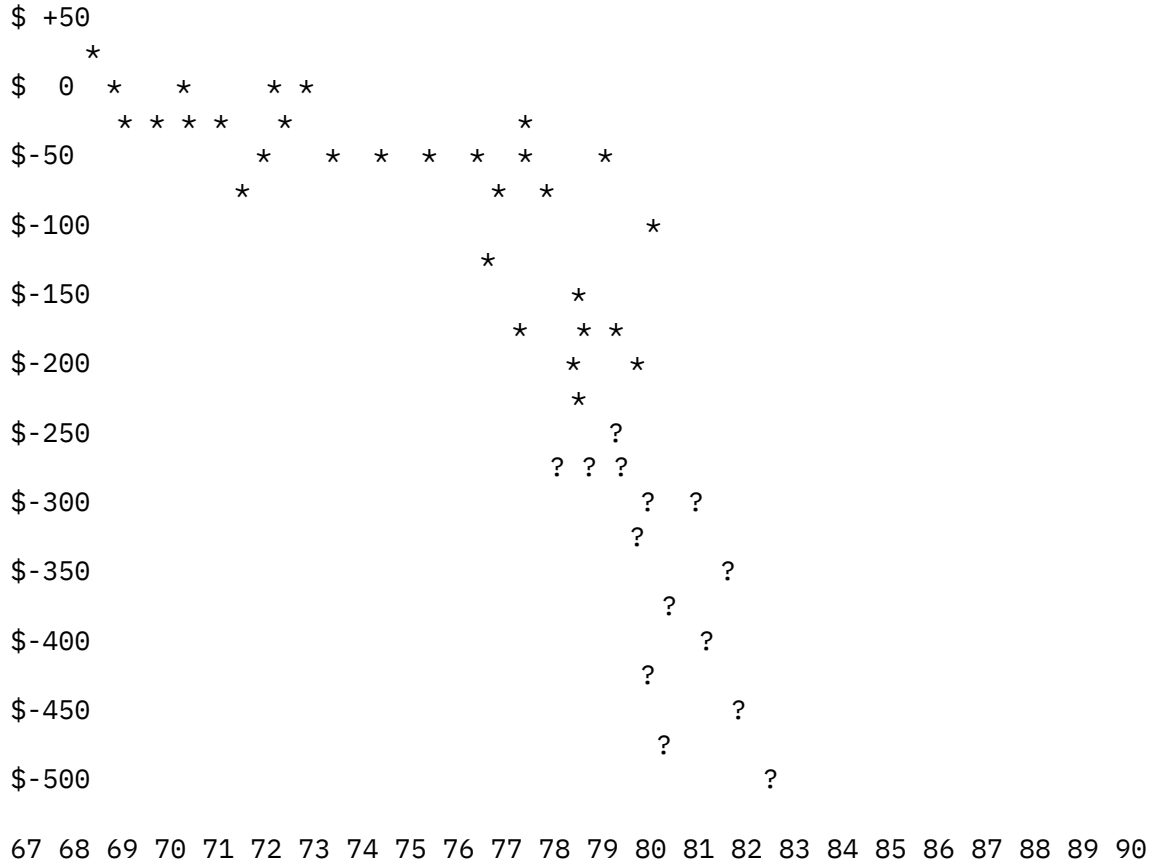
I was really impressed that they are TALKING about PROMISSING a balanced budget
by 1991.

a. It's curently be discussed in Washington, DO SOMETHING!

b. Promisses by governments are usually broken.

c. What about the unfunded stuff? it's more important!

d. What about the current trend?



So, by this simple graphical extrapolation it currently looks like by 1990:

```
Yearly Deficit:        $-500Billion/Yr        $2,500/Yr/Person

Federal Debt:      $4 Trillion        $20,000/Person
      +                 +                  +
Unfunded Dept:         $20 to 50 Trillion $100,000 to 250,000/Person
--------------         ------------------ -------------------------

Total Fed Debt:        $25 to 55 Trillion $120,000 to $270,000/Person
                              (  HALF A MILLION )
                              (  PER UNIX HACKER )
```

Of course the congressive tax will shift the major part of that burden to those with something still left to take. Now, you could call up your congressional aids and demand that they balance the TOTAL budget NOW. But like most civilizations we won't respond to the threat until their knife is up against our throats.

Oh yes, there is another solution. The Federal Reserve open market commitee can 'buy' the tressury dept and then issue Federal Reserve Notes on it. After all Debt is good collateral, right? It's called printing money. Marx promoted it as a way to distroy a free/market-based society.

Sorry for flaming so long and posting in net.general.
If you care, a quick phone call to Washington MIGHT help.
--

Summary:

In article <1178@mhuxt.UUCP> rma@mhuxt.UUCP (ATKINS) writes:
>Does anyone know where I can find out the scheme used for
>stereo sound transmission on broadcast TV signals? Looking at
>the signal it seems to be some kind of sub-carrier system, but
>not (L+R) and (L-R) as in FM radio.

I tried to reply to this when you asked about it in net.audio.
Unfortunately, the system somehow ate my reply before I could get it
properly posted. In my frustration I gave up. Since no one else has replied
I thought I would try again.

Being an EE in the Television Products Division at Tektronix, I have become
familiar with the American stereo TV system, known as MTS or BTSC.
MTS does transmit L+R and L-R, but not the same as FM radio.
First, the frequencies involved are different. MTS uses 15.734 KHz for its
pilot and 31.468 KHz for the L-R instead of the 19 and 38 KHz of FM radio.
15734 Hz is the horizontal scanning rate in US TV's, so it was chosen as
the basis for MTS to reduce interference between the horizontal circuits
and the stereo decoder. TV people call this frequency H. Thus, the pilot
is at H and the L-R is at 2H.

The principal difference between TV and FM is that the L-R subcarrier in
BTSC is compressed before transmission. This was done to reduce noisy reception
in fringe areas. Although designed by dbx, the companding system used for
stereo TV is not the simple linear 2:1 system used in their tape noise
reduction systems. In TV stereo, the companding is both amplitude and
frequency dependent. This makes the expander circuit fairly complex and I'm
afraid no one has managed to squeeze it into a single IC (yet). (Actually, I
have heard of one company that it trying to develop a digital TV stereo chip,
but that's probably still a couple of years away). The present decoders have
lots of discrete components and about 8 trimpots, so you can see there is a
lot of room for improvement.

For the sake of completeness, I should mention that BTSC provides for two other
subcarriers, SAP at 5H and PRO at 6.5H. SAP stands for Second Audio Program
and is indtended for bilingual broadcasts (e.g., SAP can broadcast a dubbed
foreign language version of the audio). SAP is FM modulated and dbx
compressed. I beleive the frequency response is somewhere around 10 KHz.
The PRO (PROfessional) channel is for data or low-grade voice transmission and
is not intended for the general public.

So far, the is one station using SAP (to transmit in Spanish). The TV industry

predicts there will be 200 stereo TV stations on the air by the end of the year.

I hope this helped!

Their is a simple reason for the 0.95 factor involved in calculating the
lenght of a dipole: the speed of light moves slower in air than in vacuum.
The 0.95 factor is the speed shift.

Second, that formula is an approximation. (a very good approx.) Most of us
cut the lengths on the long side and tune (cut) it as close to 1:1 on the
SWR.

Subject: Slow Russian broadcasts
Newsgroups: net.nlang net.ham-radio net.wanted

Hello. A friend and I are enrolled in a beginning Russian course here, and would like to know the times and frequencies of any shortwave broadcasts in slow Russian. I know that the VOA broadcasts in "special English" and Radio Peking has a regular show of instruction in Chinese, so such shows do exist. Does Radio Moscow, Minsk, Vilnius, etc, or anyone else have a regular program for Russian instruction or in slow, easy text?
Thank you very much.

Remember vacuum tubes, you know, the things which have little heaters inside? When I was in high school, we had no trouble coming up with them, sockets, chassis, power supplies, butterfly type variable capacitors for push-pull tube RF amps, and all that jazz.

I'm working on a project where I need these kinds of things, but they are pretty darn near impossible to come by. (I'd prefer tubes because constructing VHF solid state class "C" amplifiers is expensive...I expect to blow up more than a few active devices in the process...)

Somewhere, sitting in someone's basement, there e ssits eexactly what I need: a chassis, with several stages of push-pull RF amplification, preferably at 6 meters. A power supply is not required but would be nice. Total power output should be in the 10 - 30 watt range but I will entertain others. This device will be employed in a project which WILL have the blessings of the FCC before being put on the air (it will also be modified). I will consider single-ended gain but would prefer the former type.

One-tenth watt driving power is available. Of course, if you have a **real** commercial FM transmitter of the 10 watt variety, I cn use this too (or exciter). This would have to be of the direct FM type.

Please indicate if you have spares for this device.

Again, I emphasize that the project will be FCC licensed under part 74 of the Rules and Regulations, and is absolutely not to be used for illegal purposes. I'm not trying to cop a CB linear or similar device. Supervision will be by several general class operators and highly sophisticated equipment; again, this is strictly on the up and up.

Owners of suitable equipment, please state what you would have to have for it, and contact me directly via UUCP or snail mail:

[....]

I have found that I am listening to my satellite dish much more than
watching it lately. I suggest anyone with a dish get off Galaxy I
for a while and listen to Keith Lamonica on Telstar 303 (a couple of
degrees East of where Comstar D4 was), transponder 18. The program
is a "call in" type and really generates some interesting conversations.
He is on each evening from 8:00 P.M. central time until 10, 11 or 12,
whenever things die down! On Sunday evenings, he is starting to have
video, although I think I like just the call in better.

I would like to hear from any other individuals who have been listen
to him... If you value your _RIGHT_ to own and operate your own
Earth station, I suggest you listen in!

Happy dish fishing!!

[....]

I have found that I am listening to my satellite dish much more than
watching it lately. I suggest anyone with a dish get off Galaxy I
for a while and listen to Keith Lamonica on Telstar 303 (a couple of
degrees East of where Comstar D4 was), transponder 18. The program
is a "call in" type and really generates some interesting conversations.
He is on each evening from 8:00 P.M. central time until 10, 11 or 12,
whenever things die down! On Sunday evenings, he is starting to have
video, although I think I like just the call in better.

I would like to hear from any other individuals who have been listen
to him... If you value your _RIGHT_ to own and operate your own
Earth station, I suggest you listen in!

Happy dish fishing!!

As far as I know (and I am an engineer not a lawyer) there is at least one other law (than 605) that concerns interception of telephone calls and that is the Omnibus Crime Control and Safe Streets Act of 1968. This law which is section 2115 of title 82 (?) of the US Code is the basic federal anti-bugging/anti-wiretapping statute. Among other thing it forbids interception of any common carrier communications of aural or visual material that travels by "wire, cable or other means".

It also forbids interception of any aural or visual material that travels for any part of its trip on a common carrier channel even if it is not being intercepted from a common carrier channel.

And unlike section 605, 2115 forbids interception alone, not just interception *and* use or disclosure. I believe the operative phrase is something like "whosoever intercepts ..." as contrasted with 605's "whoseover intercepts and discloses ..."

2115 establishes both stiff federal felony penalties (I think 5 years and $50,000 fine) and, interestingly, also civil penalties (someone whose communications have been intercepted can sue the intercepter for damages).

I do not know if 2115 is considered to apply to radio communications by common carriers, as I remember it it doesn't mention radio in this context, and because 605 is specifically about radio communications it might be assumed to take precedence.

If 2115 is considered to apply to radio communications it would very clearly forbid even casually listening to any common carrier transmission whether or not any use was made of it's contents and even if this act of interception was in the privacy of one's home and did not involve disclosure. And a surprisingly large fraction of radio transmissions could be considered common carrier. For example SCA subcarriers, scrambled TV stations, virtually all mobile, marine and cellular phones, almost all satellite links (the transponders are owned by a common carrier and often leased to another common carrier that actually uses them to transmit information such as cable tv feeds), MDS transmissions, and almost all commercial users of the hf spectrum are common carrier services or could claim to be.

In addition many non common carrier transmissions that have simply been routed via common carrier facilities at some point in their path could claim protection under 2115 (for example one could argue that if the local police use a leased telco line to connect to their transmitter site on a nearby hill then simply passively listening to them is a violation of 2115 since the communications went by common carrier for part of the way).

How does 2115 apply ?

I do not know where the fine line has been drawn by the courts in interpreting 2115. (I would appreciate citations of cases if anyone reading this knows of some). It certainly is true that nobody was prosecuted (that I know of) for watching satellite cable tv feeds even though these are clearly common carrier transmissions of aural and visual material. (It is currently quasi-legal to watch unscrambled satcom cable feeds under another act of congress). Yet there have been at least attempts at prosecution of people who have received the same video and audio (mostly HBO) from 2150 mhz MDS transmissions. I find that distinction puzzling since I cannot see a significant difference between receiving HBO from a 4 GHz transmitter out in space using FM modulation and a 2 ghz transmitter on the top of some nearby tall building that uses AM.

Lauren claims that there have been successful prosecutions of people who have intercepted telephone calls from terrestrial microwave links. (He doesn't say under what statute but I presume 2115). I also fail to see the difference between listening to a 4 ghz ground based transmitter (FM-FDM presumably) on a tvro and swl receiver and using a scanner to listen to the FM 150/450 mhz IMTS mobile telephone calls. Many thousands of scanner enthusiasts listen to mobile phone conversations - yet I have never heard of a prosecution for merely listening to these common carrier transmissions (I think there have been some or at least some attempts in cases where information was disclosed or put to some use), and yet the distinction between microwave and vhf listening is widely presumed to exist.

So the law is murky and even murkier in the area of intercepting satellite signals. It is apparently more likely to get you prosecuted if you intercept ground based microwave links (VHF/UHF is probably OK) and more complex signals (simplex FM is very safe). This makes little sense since these are all radio signals, all carry private communications that the users presume will not be disclosed, and all can be received with standard consumer equipment widely available to average people. Perhaps the only distinction is that millions know how to listen to calls on on their scanners, and until recently when several recently published books on tvro systems broached the subject there was a conspiracy of silence surounding simple methods of intercepting microwave multiplex FM signals.

The data loophole

There is one important hole in 2115 however, it carefully aviods mention of data, record (telex and the like), telegraph, teletype, facsimile and other forms of non-voice, non-video information transmission. It has been widely reported that this was at the behest of the NSA which had (at least in 1968) much more capacity to process and filter out material of interest in these forms of communications than it had to monitor telephone calls (which take (or took) human transcribers to laboriously take down the words). Apparently the courts have upheld this loophole, as there has been some recent effort to get congress to close it.

Conclusion

The intent of my posting on tvro interception of calls was to make a point about the vulnerability of microwave transmissions

to interception by common consumer tvro and swl hardware owned by millions of people, many of whom live within easy receiving range of ground based microwave systems, and all of whom are in range of satellites carrying significant interceptable telephone traffic. Whether or not it is legal, whether or not it is covered by 2115 in addition to 605, it is clear that the proliferation of the hardware required into the hands of millions of Americans, many of whom beleive that it is their God given right to listen in to anything they can pick up, is going to make long distance telephone and data transmissions significantly less private.

I am personally an advocate of what is becoming a more and more widely accepted national goal, and that is routing all long distance traffic via paths which cannot be intercepted by casual listeners with widely available equipment. At the minimum this means digital microwave transmission under DES or better encryption. Hopefully in many cases it will also mean fiber optic paths (which are at least much harder for the KGB and friends to tap than microwave or coax links). I have always felt that making an act as passive and invisible as intercepting a radio signal a serious crime was the wrong approach. Prosecution of such acts is necessarily so erratic and dependant on violations of the privacy of whoever is intercepting the signal that it seems worse than the crime in all too many cases.

Perhaps more fundementally, the secret nature of listening guarentees that someone whose purpose is more sinister than casual observation of the electromagnetic fields around his back yard can almost always intercept whatever he needs to with little or no chance of getting caught. For this reason draconian laws only serve to reduce the number of harmless casual snoops, without doing much of anything about the professional information thief. Limiting efforts toward prosecution, however, will tend to force those who set up systems to consider designing in security by using encryption and transmission media that cannot be readily tapped, rather than living in the fools paradise of assuming that since it's illegal nobody will be doing it and communications are secure.

And as someone on the net pointed out, the difficulty of proving interception took place will soon lead to proposals to make mere possession of equipment that could or might intercept private transmissions a crime. This of course will be rather interesting since there are so many examples of legitimate radio equipment that could be used to pick up forbidden private signals by merely pointing the antenna differently or keying in a slightly different frequency. This of course will result in licensing of such equipment only to people who have a proven need, and while once you could listen to your local fire department if you are a volunteer fire fighter or the airport control tower at your local airport if you are a private pilot you will probably have to prove need and be registered to own a receiver that covers other than the broadcast band (and let the heavens quake if you should decode an SCA subcarrier from an FM station). And think of all your neighbors accusing you of tuning your radio to a forbidden channel just because they don't like your lifestyle!

I think it is too bad in this age of the digital revolution in transmission and storage of information and of readily available digital security devices to depend on oppressive legal avenues to protect communications that can be effectively secured by encryption. But that seems to be the direction in which the courts are going.

ONLY if I use what I hear!! I can listen as much as I want, I just
can't use or repeat it. Maybe you better explain that to your
prominent Washington attorney.

Once again, I've been merely reporting on how the courts seem to be
treating these subjects--I don't necessarily agree with all of them!

As I recall, one of the prosecution issues revolved around "reasonable
expectation of privacy." That is, when you make a mobile telephone
call you apparently have less of an "expectation of privacy" than
you do when you make a non-mobile to non-mobile call. I'll try
dig up some references...

KEYS:/LEAHY'S ELECTRONIC COMMUNICATIONS PRIVACY ACT / A START/

This report from Billye Leymon of the MetaNetwork:

Thought you'd be interested in this:

 Senator Leahy to propose Electronic Communications Privacy Act

 This afternoon, at the first annual meeting of the Electronic
 MAIL Association, Senator Patrick J. Leahy (Democrat-Vermont)
 announced his intention to introduce the Electronic Communication
 Privacy Act of 1985. When the Senate reconvenes, similar
 legislation will be introduced in the House. In his address,
 Senator Leahy focused on the complex public policy problems which
 have emerged with the increase of computer-based communications.

 Policy is now needed to protect the privacy and security of
 communication exchanged via new technologies, so that citizens
 may feel as secure using newer communications media as they do in
 using the mail services or the telephone. At present, the
 Federal legislation enacted in 1968 on the illegality of
 wire-tapping is the only act which might apply to privacy of
 communication issues. That legislation designed to protect voice
 communication via common carrier is no longer adequate, as
 protection is extended only to communication "capable of being
 heard." According to the Senator, current federal policy needs to
 protect "WHAT is being transmitted, not the WAY it is
 transmitted."

 The Senator, Vice-Chairman of the Senate Select Committee on
 Policy, is committed to the protection of private communication

from any source, be it government itself or a private, undetected perhaps, intruder in a database.

The to-be-proposed Electronic Communication Privacy Act of 1985 will make five important changes to the "wire tap laws." As outlined, these changes will:

- extend coverage from "voice" to all electronic transmission
- recognize private carriers, so that all communications systems will be covered, not just common carriers as at present.
- institute civil and criminal penalties for illegal access.
- institute civil penalties for _disclosure_ of private information stored on any system.
- for law enforcement, require that a court order be obtained before accessing information stored on private communications systems.

Their has been much talk on the net with regards to our "freedoms" to listen to radio transmissions and the legallity of this listening.

I called the F.C.C. this afternoon and spent about a half hour speaking to them on this subject. I wanted to set the record straight in my mind as to what the law was on this matter. I must tell you frankly, that their are many people out their that are misinformed in this subject and I was one of them.

First and foremost... listening to Common Carriers IS wire-tapping and illegal! It smacks a 10,000 dollar fine and five years. (Some states impose their own

penalties on top of the federal penalties.) When and if you listen to a phone conversation transmitted on a common carrier band, it is tantamount to plugging into the cables between the conversing parties. By law, the line is se cure.

Radar Detectors... The F.C.C. regards these as RECIEVERS and they are legal. States have the right to ban them. (That issue is somewhat mute and needs further definition.) They don't operate in the forbidden common carrier bands so the F.C.C. has no problem with them.

For those that would like to read further on the subject, I was told to see sections 301 and 605 of the Communications Act of 1934. Title 18 was suggested reading as well.

Anything outside of the common carrier bands is legal to listen to.

Let's move on and drop this subject. Their's been too much attention paid to this subject on several nets. All it takes is a phone call to the proper agency and they can and will point you to the rules, regulations and the law.

Summary: NSA does legal wiretaps by "only" listening for touchtones, u can 2

The last time the wiretapping laws were hacked, the NSA suggested (and
got) a small wording change that effectively makes it legal to listen
in AS LONG AS YOU ONLY LISTEN TO TELCO SIGNALLING rather than user
data/speech. This means that, for example, receiving microwave phone
transmissions is defensible if your equipment filters out all but the
"who called who" info. They wanted this because it gives them a legal
reason to have tapping equipment always installed. (Who's to know if
their equipment happens to switch to recording speech or data if an
interesting phone number makes or receives a call?)

It would be interesting to see them try you for it -- if they found
you guilty, you could sue the government to stop the NSA.

Please correct me if I'm wrong, Lauren.

Summary: German listening laws

In article <127@hydra.UUCP>, die@hydra.UUCP (Dave Emery) writes:
>   And as someone on the net pointed out, the difficulty of
> proving interception took place will soon lead to proposals to
> make mere possession of equipment that could or might intercept private
> transmissions a crime. This of course will be rather interesting
> since there are so many examples of legitimate radio equipment
> that could be used to pick up forbidden private signals by merely pointing
> the antenna differently or keying in a slightly different frequency.

My brother-in-law, a German airlines pilot, likes to tell the story of
one airlines Captain who lost his commercial license because he was
discovered listening to airplane conversations with an unlicensed
receiver.

In Germany the Post Office has the functions of our FCC, and you are
NOT allowed to monitor anything non-commercial without a license. In
the case of this pilot, the German supreme court overruled the PO,
on the grounds that loss-of-livelyhood was excess punishment, but
they kept his receiver system.

Bob

Just would like to say to all the electronics, scanner, and radio enthusiasts
out there:

Welcome to the world of persecution and harassment by government that we
firearms enthusiasts have been experiencing for the last century or so!

Isn't it wonderful when your relationship with what is *supposed* to be an
organization dedicated to SERVING your needs (government) is instead a
continual firefight and struggle to simply be *let alone*?!?!?

Plus, of course, you can NEVER win; you can only stave off further
encroachment or assaults until they decide to attack you again...

Will

A friend of mine (Les VE5DS) heard on the amsat net that there are some
changes that have to be made to the W3IWI software to make it work in 1986.
Some QRM got in his way though. Can someone tell me what precisely were
the changes and what do they do (i.e. why are they required?).
Tnx + 73

The way I heard it, what actually happened is that courts have ruled
that telco can track and deliver to authorized agencies the
numbers dialed on particular phones without a "wiretap" court
order. This is considered to be about the same as a "mail watch"
where the post office keeps track of return addresses on mail
to a particular point.

In both cases, I suspect that only the particular entities specifically
authorized (i.e. telco and post office) have the appropriate permissions
for such activities--I doubt if the permissions extend to the
public at large. I'm speculating on the details of this point,
so don't take this message as gospel.

A letter from Lou, K2ANC, has prompted me to post this note regarding
DX contacts.

Outside of the occasional ARRL dx bulletins that I post, there has been
little about DX contacts on the net. From other comments I receive,
I would say there is pretty good interest in DXing. So the question is
should I or someone collect dx station info to be summarized and posted
to the net (weekly)? Or should active dxers each post their own interesting
contacts? Lets's hear some ideas/opinions.

qst de k9eui
hr arrl propagation forecast bulletin nr 36 from arrl headquarters
newington ct september 8, 1985
to all radio amateurs bt

(((((accuracy not guaranteed due to poor conditions)))))

the almost total solar calm that (started) nearly a month ago
is still with us. the solar flux has been no higher than 72
since september 1, and it was down to 69 by the 8th. the flux
was even lower 4 weeks ago, so readings in the high 60s are
expected through about september 13. the sun is moving to its
most favorable position for the northern hemisphere so
propagation will tend to be good on 14 mhz and lower bands much
of the time. a small flux rise will bring 21 mhz to life,
especially when the wwv k index is 2 or lower. even 24 and 28
mhz have been good on the ? days, but thus far they are usable
only on transequatorial or other low latitude circuits. flux
values in the middle 70s or higher will improve conditions on
24 and 28 mhz quite markedly when the k index is 2 or lower.
the k index trend is important so a new value is given every 3
hours. the a index is a 24 hour figure, more useful for
statistical purposes. the k index values are expected to be
higher during the middle of september but this will tend to be
offset by the improving sun position. the qst propagation
charts should be more (accurate) this fall. they are now based
on solar flux values in the low 70s, more in line with what can
be expected in the coming weeks.

american sunspot numbers for august 29 through september 5 were
between 0 and (3?) with a mean of (.4?). ar

As I understand it...

The new (now old) push is for DEregulation. It appears that attempts to limit *monitoring* is not in step with FCC and Feds efforts to that end.

Amatures have seen an almost 'washing-of-the-hands' as far as FCC rules and regs violations go. That is to say, amatures do the foot work, then document-document-document and then with enough complaints, the FCC MAY take action against the violator.

Bearcat 250; one of the most popular scanners on the market...

WHO made the original demands to limit the tunning range(s), FBI, CIA, FCC, USA? I would sure like to see the letters, memos or read the notes from the meetings! What kind of 'pressure' was applied to Bearcat assure compliance with the feds desires? Perhaps threats of no FCC equipment certification? (Some newer scanners now offer almost full-spectrum tunning).

Looking at the technical manual for the Bearcat 250, a simple vco voltage controls what frequency is monitored. It is apparent that if one simply injected a adjustable control voltage, FULL-spectrum tunning is possible within all three of the bands! I expect that one could tune even higher and lower of specified limits with some loss of sensitivity at the band edges. Bypass the memory/processor and it's done. I add that there ARE program 'tricks' that fool the processor, however, there is a loss of receiver sensitivity. There are limits to the 'tricks' too, only a few more MHz are added with this method.

The next logical question is: Who will monitor the monitors?

Actually, traffic analysis (knowledge of the sources and destinations
of a large group of messages) is an extremely useful form of intellegence
collection -- knowledge of where and in what volume is remarkably useful.
Thus, even if NSA equipment only checked destination and source for a
message, they would certainly have a use for the information.

I don't want them to listen to me, but I also don't want them to know my
correspondents, either ...

>First and foremost... listening to Common Carriers IS wire-tapping and illegal!

I think I must be misunderstanding the discussion. You responded with the oft-quoted information that listening to "common-carrier" data is wiretapping. But this discussion was about listening in on satellite beams which were broadcast at you. The satellite issue has been addressed frequently by people with a lot more at stake than you or I; and the supreme court has ruled that people are entitled to listen in on the satellite broadcasts.

Not only that; (and this applies to your radar detectors as well;) I am a licensed amateur operator and it is quite legal for me to transmit in those bands... What makes you think that it's illegal for me to receive my own transmissions?

There are about five or six different understandings about what we've been talking about here. I originally got into this about the "loss of freedoms" discussion. I own a satellite receiver; as do several of my friends, and none of us were aware that anything had changed. From your comments about the FCC, I must conclude that nothing has; we're just talking about separate things.

You can't win because people like you and I, Will, favor privacy as
one of our basic freedoms. Especially privacy from the government.
But that has to extend to privacy from other individuals. I also happen
to believe in property rights and free enterprise, and feel that there
are property rights involved in the use of the radio spectrum.

Thieves and eavesdroppers get no respect from me.

> Anything outside of the common carrier bands is legal to listen to.

So what does the FCC include in their definition of a common carrier?
Satellite TV? Private "cable" TV using microwaves?

thanks for the definitive scoop,

Mobile telephone services are common carrier.

Does the Washington attorney consider listening to these calls on a scanner,
as thousands of folks do, to be "wiretapping"?

maybe i've missed this point, so forgive me: if i watch network TV,
i am paying to watch it indirectly (the cost to the advertisers is passed
thru in the cost of the product). if i watch cable TV, i am paying to
watch it directly (the monthly or whatever cable charge). if i watch
satellite TV, using my own dish, i am paying for it (cost a fair bundle
to get that baby!). so i'm *NOT* freeloading.
     i recognize the cable people may get upset over the intercept.
but the solution is for them to get into the satellite dish business
(Yes, Mr. Customer, we're glad to serve you. How do you want it?
Monthly cable charges or monthly payments on these fantastic dishes?)
     besides there are gobs of places not served by cable (and not too
well by networks, either). e.g., ever drive thru northern CA or Oregon?

I recommend strongly that a new info-net be started. It should be one
dealing exclusively with eavesdropping on telephone conversations by
TVRipOff dishes (isn't that what tvro means?), by microwave ovens, by
electronic wristwatches, by any tool the morbidly curious want to use
for their homegrown surveillance. Another section of the new net can
deal with any aspect of real or imagined legal information pertaining
(or not pertaining) to such activity.
But leave me out of it! What connection anyone sees between all this
b**l sh*t and amateur radio escapes me.
73 to some (probably most) of you.

Would LOVE to see/hear more about DX on the info-net. When I
have time to work some, I'll be happy to post my info. Hope
other colleagues will do the same. My FO0XX cards arrived
yesterday, and I need to work one more to submit for 290.
No big threat to the big guns on the Honor Role, but working
on it.

I would think it would be better if someone summarized and posted, then if
anyone was not interested they would only have one message to delete, rather
than dozens to wade through. But I like the idea, I'll read it for sure.

One comment, then I'll sign here. There is another issue, that legal
or not, in order to be prosecuted, one HAS TO CATCH YOU doing it. I
think that a good number of people are protected in the scanner
environment by laws precluding unreasonable search and seizure (even
if what they are doing may be interpreted as being illegal).

Really, folks, haven't we beaten this dead horse enough???

I, too, suspect that there would be considerable interest in DX info
on this net. I want to suggest that you expand the scope to include
the AMSAT DX info, which you may be able to get through KA9Q, who is
on this list. The Amateur Satellite DX group is quite avid.

As for myself, the interest is VHF DX - primarily six meters. I did a
one-man DXpedition to FG0 (FG0HZW) in June-July 1983. All operation
was on six and I had about 180 different contacts (mostly US) in the
two weeks. The ONE main central source of VHF/UHF DX info is W3XO, who
does the column in QST - but he isn't on this net. K2UYH is the center
of 432 (moon) DX news. The 'real' jobs of these people:

W3XO, Johns Hopkins U., Applied Physics Lab.
K2UYH, Trenton (NJ) State College.

Again, keep up the DX news.......

qst de k9eui
hr dx bulletin nr 36 from arrl headquarters
newington ct september 12, 1985
to all radio amateurs bt

thanks to kb1be and the connecticut dx association for the
following dx information.

the congo. tn8ee is active on 20 and 40 meter cw, around 1930z
on 14029 khz and later on 7 mhz. he is expected to be on ssb
on friday the 13th, at 2130z on 14236 khz.

grenada. don, j37ah, is back on grenada and is very active on
the 20 meter ssb nets. he plans to operate on 40, 80 and 160

meters this fall and winter.

kermadec island. chris, zl7oy, returns to kermadec around september 20 as zl8oy. after october 1, his call will be zm8oy.

tokelau islands. ron, zl1amo, will activate tokelau october 10 or 12 for a dxpedition as zk(??) replacing the zm7 call. look for him on 20 and 40 meter cw. there will be some ssb operation as well. he is expected to be on 14236 khz at 2330z on october 19 and 26.

belize. wa6vnr is expected to operate v3cq october 1 through 7.

macao. ks9p is expected to operate xx9sp from september 22 through 28.

heard island. vk2bcc, a radio technician aboard an antarctic research institute ship, nella dan, will be on heard island in late september for a five week stay. his call will probably be vk0cc. jim smith, p29js/vk9ns, will try to have him on his 14220 net whenever possible.

willis island. vk9zb is active on 14220 khz at 0700z, and may also be found on 40 and 75 meter ssb around 1000z.

beacons. a new beacon, lu4aa, began operation on september 3 as part of the ncdxf 14.1 mhz cw beacon net. lu4aa will key for one minute each ten minutes in the 0008 time slot following zs6dn/b. another new beacon, hk4lr/b, is expected to begin operation soon in the 0009 time slot. further information on the beacon net may be found in june 1983 qst ar

I am currently looking for a high speed modem (56kb/s), to be used for
communications between an SNA network and an Ethernet network thru
a gateway. I would like information anyone may have regarding vendors
who produce a reliable device. Please include any information you
may have on these vendors and approximate prices.

There's an interesting circular argument forming here. It is said that listening in on cordless phones isn't illegal (and police don't need a warrant to do it) because it's so easy; i.e., there is no "reasonable expectation of privacy". But if listening in on a common carrier's trunks is almost as easy, then why should their customers have any greater "expectation of privacy"?

Phil

Theft is Theft.

I started poking around the terrestrial and then the celestial microwave spectrum in the mid 70's. Amoung the things I found were the very powerful (someone told me 100+ watts) MDS transmissions that carried HBO and of course the satcom cable feeds (which were much harder to receive) and various terrestrial feeds that all carried the HBO signal. I thought long and hard about whether I had any right to watch movies from these HBO signals and decided that in doing so I was obtaining a service that

I would otherwise have to pay for, and which someone paid to provide, transmit and so forth. This seemed to me to be theft pure and simple.

I could see no difference in kind or substance between paying for a copy of these signals from a downconverter or cable so I could watch them on my tv for whatever amusement I could get from the old and usually second rate movies they run, and hooking up a kluge of microwave hardware to my tv and pointing a horn out the window at Boston's Prudential building. Granted I had provided the receiving hardware, but it seemed very clear to me that I was receiving exactly the benefit I would get if I subscribed to the service. It seemed a very stretched interpretation of 605 or for that matter simple morality to argue that I had some inalienable right to use the service for free just because I provided the receiver and they beamed it at me. I was never able to rationalize my right to pirate a service that someone had gone to considerable expense to provide, so I never watched it.

I feel that this same principle applies to using any rf service for which there is a usual fee, particularly if this fee is intended to cover the costs of providing the service and transmitting it, not just to cover the cost of the receiving equipment. It seems to me that a somewhat stretched analogy can be made with the widely accepted view that it is not morally appropriate (or legal either) to copy and/or use licensed software in violation of it's license terms simply because it is easy, technically trivial, and often conveniant to do so. It seems to me that the same kind of moral scruples that lead us to frown on those who make pirate copies of our software ought to be raised when we point our tvro's at satellites that carry programming that someone paid to provide as a service they charge for.

In short, whether or not it is legal to intercept signals from one rf source or another (which was a subject of considerable disagreement on the net) obtaining a service without paying for it by intercepting such signals is theft.

The only contrary perspective I can think of is that radiation of information into space owned and occupied by others is somehow equivalent to putting it completely into the public domain (or at least ceding all rights to it to those whose space it traverses) and that the provider of a service therefore cedes all rights to collect for providing his service when he transmits it by radio. This viewpoint would give anyone the right to do absolutely anything they want with any information that alters the E or M field in any space they have control over. As a practical matter this would eliminate unencrypted radio as a medium for transmitting any form of proprietary or confidential or private information, and elevate cryptography and cryptology to the status of crucial arts.

One has to wonder whether this view is justified as one tries to balence the rights of individuals to make sense of photons impinging on them with the social purpose of providing communications and services that would be otherwise impractical or impractically expensive to provide.

In any case as a hacker, I still occasionally poke around and try demodulating random signals I find (as a strictly technical challenge and recreation) but I remain careful not to allow myself to use my knowlage and skill to obtain services that I am not paying for. My recreation (very occasional these days now I have a wife and child to soak up my time) is technically quasi-legal since I am only looking at data and other signals not covered by 2115 (did my posting on this get out?) but is probably a dying sport as broader laws and encryption steadily encroach.

I would not recomend the kind of technical swl'ing I became addicted to in my youth to a child of the modern age, aside from the fact that we are gradually waking up to the need to secure communications and starting to install encryption and non-rf links at a rapid rate, the temptation to cheat and use one's skills to obtain services grows more difficult to resist as rf based services proliferate.

It is probably better to regard listening to anything but what one can pick up on an ordinary unmodified tv or AM/FM radio as forbidden fruit, the same way we carefully avoid using a UNIX (tm) utility on an unlicensed machine.

David I. Emery Charles River Data Systems 617-626-1102

The solution for CATV companies to "get into satellite TV" is a very sticky legal issue. About 5 years ago, some podunk CATV ma-and-pa operation wanted to essentially open a ColorTyme or U-Rent franchise. Then, for one monthly payment, you'd get cable TV and the receiver(s) to watch it on. (From a technical standpoint, this isn't a bad idea. I'd much rather see the Zenith Z-TAC decoder inside the tv set instead of the demod-remod thing on top of my TV; then I'd get BTSC stereo sound at home!!!!!)

However, someone pitched a holy conniption fit over this, and it is now standard practice to include an "anti equipment leasing", directly or otherwise, in franchise agreements with communities/CATV state boards/whatever. This includes repair, sale, leasing..... (This may even go further back, coming to think of it - I seem to remember something about the Greensboro, NC people wanting to adjust IF amplifier response in certain receivers for a fee (because the people had sloppy sets back then with poor trapping) and that was thumbs down, also!)

I think it was in New York that the state's goody-goody CATV commission tried to achieve the same objective (make sure that delivery of video was over the air or through duly licensed CATV operators) by making illegal the construction of earth stations and SMATV facilities, even though some of the SMATV operators were duly licensed by the service(s) they carried! This didn't work, either, ol' Charlie Ferris's boys stepped in.

The real solution to this whole mess is to leave the electronic media alone, deregulate the heck out of it (except for technical matters such as harmful interference and so on) and let good old American engineering solve the problem of "freeloaders" with a profit motive! Things could be worse; most of the "network" stuff on Anik (ITV, BCTV) is scrambled anyway! Last I looked, you could only get CBC.

I suspect that the key is that when you use a cordless phone, you're
not a common carrier and thusly don't have the "expectation of privacy."
It gets tricky, but note that the designation of "common carrier"
exists (in part) specifically to categorize some of these issues.

I have an old Sears 2 meter rig. It seems to work ok but the audio seems
weak. Also to modify the frequency presets, it is necessary to move some
stickers around on a drum to block out certain light paths. The remaining
light paths trigger a row of diodes to select the frequency. But I don't
know if it can select to 5 kc. Does anyone out there have any information
on this rig? I believe it is made by Yeisu.

I have an old (early 70's) set of looseleaf reference material to ham
equipment from 1945 through 1973; it is called the HAM EQUIPMENT BUYERS'
GUIDE, and was designed to provide specs, original retail price, and other
info on receivers, transmitters, transceivers, and linears for the ham
shopping for used or flea-market/hamfest gear. It is a handy reference.

It was published by Alton L. Brand (WA9MBJ), at PO Box 311, Sycamore, IL
60178 (also have a street address of 415 E. Sycamore St., same town).
I wrote to that PO Box address back in 1981, hoping to locate later
volumes that would bring the reference up to include current gear.
However, my letter was returned as "Undeliverable -- unable to forward"
by the US Mail.

This publisher also produced a twice-a-month classified ad newsletter
called "Equipment Exchange - Ham Trader". I do not know if this is
still being published, under the same or a different name, by the same or
different people.

Does anyone have any info on this operation? Are they still in business
at a different address? Is "Alton L. Brand" still around, or was it
taken over by someone else, or was this one of those one-man operations
run by a retired person, which ceased when he died?

If they are still available, or if you can get an old copy, anyone interested
in older receivers and the like will find this "Buyers' Guide" a good
source of info on that otherwise-unknown dusty box you picked up at a yard
sale for $1.00!

Regards, Will

****
IF YOU DON'T CARE ABOUT THE L.A.RAIDERS, DELETE THIS MESSAGE.
****

OK LA RAIDER FANS!!! HERE's THE HOT FLASH!!!...

The "inside" news is.... the Raider games are to be transmitted on
the 12GHz Bands... Forget your 10 foot dishes... a NEW LNA to
cover 12 GHz will be required.

Sorry... I don't know of any local taverns that have the new 12 GHz
down converter in service at this time...

There are about three companies ready to deliver the new 12 GHz
LNA/System... about the same cost as a 'standard' TVRO (dish)...
The good news is, the higher frequency requires a smaller dish...
about three to five feet in diamenter... larger dishes = higher gain.

I expect VERY few networks to convert to 12 GHz because of loss of new-found advertising income satellite commercials now bring.

Uncle T.

qst de k9eui
hr propagation forecast bulletin nr 37 from arrl headquarters
newington ct september 16, 1985
to all radio amateurs bt

after more than a month with almost no sunspot activity, a small but plainly visible spot appeared near the east limb of the sun september 13. the solar flux had been down to 68 september 11 and 12, but it rose to 70 and held there for the next few days. even this small flux rise affected propagation noticeably. the 21 mhz band was active over much of the world, and 24 and 28 mhz were open to south and central america daily.

the solar flux average for the first half of september was just over 70, and most of the period was below corresponding days of the previous solar rotation. it is likely that we will see somewhat higher numbers after september 20, but no major change is expected. higher geomagnetic activity will make for erratic propagation through the balance of september.

the best advice for anyone trying to work out on 21, 24 or 28

mhz is to keep at it. the 5, 10, 15 and 20 mhz signals of wwv, wwvh, and other worldwide time and frequency stations often give good indications of the dx potential of amateur bands near these frequencies.

though solar activity is very low currently, and it has been for more than a month, this does not necessarily indicate an early end for cycle 21. lows so far have not been as deep or as long as those recorded in the final months of cycles 18, 19 and 20.

american sunspot numbers for september 5 to 11 were between 0 and 2 with a mean of 0.3 ar

> long held that intercepting point-to-point telephone microwave
> transmissions can be construed as wiretapping, by the way. I'm
> simplifying to some extent regarding the Act, but you get the idea.

The real issue is the basic principles of the ORIGINAL Communications
Act, the primary Charter of the Federal Communications Commission.

The premise of the FCC was that the "ether" (electromagnetic spectrum)
was considered PUBLIC PROPERTY. In effect, without proper regulation,
the entire spectrum would be on giant "CB" band. EMI regulations,
Liscensing,... are all means of protecting the integrety of the various
bandwdths of the spectrum. In fact, the ONLY spectrum user with any
right to privacy at all is the Defence Department. One 194? precedent
even challenged that. Therefore, if a person/corporation wishes to
obtain a liscence and use "broadcast" media to transmit information,
they do so with the implicit understanding that they waive the right
to privacy (It is theoreticly legal to monitor a long distance call
if it is broadcast by satellite. In fact, the only value of a
channel is the ability for people to recieve it.

Unfortunately, since about 1980, the FCC has all but abandoned the
original charter and principles on which it was based. Various
rulings have attempted to make the taping, reproduction, and use
of signals recieved illegal. Even though the precedents have been
set by rulings, the basic charter has been violated. Even the
basic requirements of Commercial Stations to provide "Public Service"
are no longer valid.

If the FCC terminated all ham/CB liscences, and allowed all broadcast
stations to "Charge" for the priviledge of recieving their signal
(including AM/FM and all TV bands), the public would be outraged.
But because it affects only a select few at a time, the precedents
are being methodically set up to do exactly that. Instead of needing
a liscence to "transmit", we will, in effect, need a liscence to
recieve.

Suppose the frequencies being used effected human health (X-Rays).
Do you suppose we would allow the Commercial station to DEMAND payment
for the priveledge of recieving these cancer causing rays? Perhaps
the day will come when a "radio rebellion" will occurr, could you
imagine the effect of every ham/cb operater running their old ham
gear ad satelite frequencies for even 10 minutes?

When I got my first General Class liscence, the frequencies now
used for satellite and microwave transmissions were ham bands,
now they want to charge for the use of the reciever!

>
> Please correct me if I'm wrong, Lauren.

    You are partially wrong. NSA does not NEED an excuse to monitor telecomunications traffic - the 'interest of national security' says it all. The real agencies who benefit from this decision are law enforcement agencies like the FBI, DEA, local police, etc. Telephone toll statements (and therefore signalling information) has ALWAYS been freely available to law enforcement agencies - in many cases without even requiring a subpoena. This has been considered to be no more than accounting information, and does not come under the pervue of eavesdropping statutes. Local dialed numbers have historically been available at the request of law enforcement agencies; if central office equipment did not automatically record this information, the telephone company would install a dialed number recorder ('pen register').

    There has never been any restriction on obtaining this information by bona fide law enforcement agencies. In general, up until about ten years ago only the telephone company could install a dialed number recorder. As a result

of some court decisions (including People vs Stewart 1973 in NY State), law enforcement agencies were permitted ON THEIR OWN and WITHOUT THE ASSISTANCE of the telephone company, to attach dialed number recorders to a subject's telephone line. ONLY a bona fide law enforcement agency has this right.

My personal opinion is that the telephone companies should be more cooperative with law enforcement agencies insofar as furnishing dialed number information; such cooperation would eliminate any claims that law enforcement agencies might be listening in. However, most telephone companies tend NOT to cooperate with law enforcement agencies due to a fear of 'bad press'; as a result of this NON-cooperation in the past, law enforcement agencies have been permitted to take this matter into their own hands.

I am certain that a number of people will be upset that their dialed number information COULD be obtained by a law enforcement agency without the benefit of any judicial proceeding authorizing same. However, if you are not doing anything illegal which would MOTIVATE a law enforcement agency to take this rather EXTREME step, then you really shouldn't lose any sleep over the possibility...

It may be costing you, but the provider is making zilch. In the first two cases, the entity that is providing the service sees a return. That is:

1) company pays for spot, recoups losses with additional price on product and profits by increased sales

2) company provides transmission lines or home decoder boxes and the electronics to transmit the channels, makes their profit by providing and charging for this service.

In the third case however, companies are paying the owner of the satellite for the ability to use it for their own purposes or to sell their transmissions to cable companies. When you receive that signal, you are freeloading on their information; they do not get paid for it unless the signal is scrambled and you rent a decoder from them, which immediately puts you in case 2 above. The only ones who profit from this are the commercial channels transmitted via satellite, which becomes case 1 above, and the companies that make satellite dishes, downconverters and the lot.

Of course, receiving satellite transmissions could be made into case two if the originators made some deal with the satellite manufacturers, and caused a fee to be passed on to you for the service.

Come on - there you go along with everyone else. You just ruined your
objective by including an exclusion clause. Why not go all the way and
let the industry solve all of its own problems including interference.
Eliminate the FCC. Once you stipulate something to regulate (harmfull
interference, you open the floodgates for other exceptions.

From "The ARRL Letter" August 1, 1985

"The New 24-MHz band. The board adopted this band plan for 12 meters
(frequencies in MHz):

     24.890 - 24.920   CW only
     24.920 - 24.930   CW and digital communications
     24.930 - 24.990   CW, Phone, and SSTV
Hope that was helpful to all who were wondering about the 12-meter
band!

Tom Brown KA2UGQ

I tried to send this via mail but it failed. My apologies to the net for
any inconvenience.

I have had some experience designing cheap FM stereo
transmitters. (I designed and built one as a college senior project.)
Your project sounds interesting, so I hope some of this will be useful.

First, the technique used to modulate FM stereo onto videotape is
different than the one used in broadcasting. The Beta/VHS Hi-fi systems
use two separate FM carriers, one for each channel. On the other hand,
FM broadcasting modulates the baseband with mono (L+R) and a 38 KHz
subcarrier with L-R information. The subcarrier is AM double sideband,
suppresed carrier (DSB-SC), and a 19 KHz pilot tone is needed to
properly demodulate this signal (also provides a way for your receiver
to tell if an incoming signal is in stereo). To regenerate the L and R
channels, they are mixed in the following way.

```
(L+R) + (L-R) = 2L
(L+R) - (L-R) = 2R
```

Thus, a simple matrix will decode the signals. Mono receivers demodulate
only the baseband signal (L+R) and ignore the subcarriers. Thus, the FM stereo
signal is compatible with both types of receivers. (You may already know
all of this, but I thought I'd include it for completeness.)

You are right that PLL is the way to go. As part of my project I looked at
several ways to generate a stable carrier and digital frequency synthesis
was by far the best and cheapest. My design uses a transistor oscillator
with varactor diode tuning to generate the FM carrier. This is divided
down to ~1 MHz with digital counters and fed into a CD4059 modulo-N counter.
The CD4059 can divide by any number between 3 and 9999 inclusive and is
programmed with with a 16-bit input consisting of four BCD digits. This
made it easy to use dip switches or thumbwheel switches for tuning.
I am not aware of any versastile divide-by-N counters that operate up to
100 MHz, but there are high speed decade counters that run this fast.
Therefore it was easy to divide the carrier frequency to the slower rate
needed by the 4059.

The phase comparator was a CD4046 PLL chip with the internal VCO disabled
(it only goes to 1 MHz). The frequency out of the 4059 was 1 KHz, thus
a 1 MHz crystal oscillator followed by a divide-by-1000 counter (MC14559)
generated the reference frequency.

I should stop here before I get carried away. If you would like to know more about my design (e.g., schematics), let me know.

There are a couple of companies that offer plans, boards, and kits for FM stereo transmitters, some of which use PLL synthesis and dipswitch programming. I have included their addresses below.

A 6-meter beacon will soon be operating from FN41 on Cape Cod.

The frequency of the beacon is 50.070 MHz and it ID's in slow Morse Code as W2CAP/B. The beacon will have a Yagi at >100' aimed at Great Britain. The sponsors of this machine include K1VZI, K1MUC, and W2CAP.

     As of this mailing, the beacon is on the air most evenings at W2CAP's main QTH south of Boston.

I must disagree with what you are saying about tvro being illegal to receive. Congress just ruled late last year that as long as a signal is NOT encrypted, it is legal to receive it, where there is no established means of paying for the service. Don't get me wrong, I have no problem with paying for HBO (if I wanted to watch it) on my tvro or even CNN, but I will not pay a 1000% inflated price to do so. I currently have a tvro and also have cable and PAY for a premium service. However, there are people out in the 'sticks' that will NEVER have cable. Why should they not be able to erect a dish and receive these services? Sure they should pay for them, but why should they pay the middle man (cable company) for their equipment when they have their own? All the tvro owners are asking is for a fair shake. The cable companies have gone out of their way to kill any competition from the tvro market... They run advertisements in local papers to scare perspective buyers into thinking the "sky will go dark"... Where is judge Green when he could do something useful???

I'm mad as hell... and I'm not going to take it anymore!!!

Further clarification...

According to the "World Above 50 MHz" column in the September 1985 QST,
one hundred G-land hams have permits that allow them to transmit on
6 meters after 2230Z. The column didn't say what time the Gs must stop
transmitting on 6. The column also says that both 6/10-meter crossband
as well as 6-meter single-band QSOs were had on July 2, 1985.

In addition, the "IARU News" column in the same issue of QST said that
the 50.0 to 50.5 MHz band is expected to be allocated to British hams
sometime this fall.

I don't know how many VHF contesters are on this mailing list; however, I would like to collect people's results and post them in a single listing to info-hams. I just can't stand waiting several months for QST to do it.

If you are interested, mail your results to wjc@ll-vlsi. Please give number of QSOs (not QSO points) and grids per band, your grid and ARRL section, and the callsigns of your operators. I would also like to see mentions of any openings you observed.

To answer Steve's (possibly some others as well) question on VLF, here are the basic rules as quoted from Part 15 of the FCC Rules:

15.111 OPERATION BELOW 1600 kHz:

A low power communication device may be operated on any frequency between 10 and 490 kHz or between 510 and 1600 kHz subject to the condition that the emission of RF energy on the fundamental frequency or any harmonic or other spurious frequency does not exceed the field strength in the following table.

Freq (kHz)	Distance (meters)	Field strength (uv/meter)
10 - 490	300	2400/F (kHz)
510 - 1600	30	24000/F (kHz)

15.112 ALTERNATE PROVISIONS FOR OPERATION BETWEEN 160 AND 190 kHz:

In lieu of meeting the requirements of 15.111, a low power communication device may operate on any frequency in the band 160-190 kHz provided it meets all the following conditions:

(a) The power input to the final radio frequency stage (exclusive of filament or heater power) does not exceed 1 watt.

(b) All emissions below 160 kHz or above 190 kHz are suppressed 20 dB below the unmodulated carrier.

(c) The total length of the transmission line plus the antenna does not exceed 15 meters.

One publication dedicated to VLF experimentation is called "The Lowdown". It is a monthly publication and the cost used to be $10/year.

There have been some real DX contacts made on the 1750 meter band, I am told. Some stations have worked several hundred miles. It appears that the only way to get a decent signal out is to use a vertical and lotsa radials. Antenna efficiency is poor, to say the least. 15 meters (50 feet) on 1750 meters is about like trying to use a 2 meter whip on 160 meters!

The only commercial manufacturer of transmitting equipment that I have seen is Palomar. They also make a receiving converter. Surplus ARC-5's and some other surplus VLF receivers are also popular.

With a 15 foot loaded vertical mounted on a 50 foot chain link fence, I have been heard a mile away (not very impressive, huh). There are supposedly quite a few experimenter's "beacon" stations on at night and weekends, but I have never heard any myself. "Call signs" usually are the experimenter's initials. DO NOT USE AMATEUR CALLS THERE! Because there are megawatt stations on this band in Europe and the USSR, one must pick a frequency carefully to avoid getting clobbered. Shielded loops, loopsticks, and some active (whip) antennas are the best for receiving.

Actually I can't answer the question about when, in the morning, the
Gs have to go off 6-meters.

As for transatlantic QSOs on six..... Yes there were quite a few
contacts between New England and UK on six on July 2. One or two contacts
were made from as far south as the Washington area.

There was another opening (also Es) on 30 July. This was from Philadelphia
on south, so we had a chance here in the DC area. I worked 6 Gs (including
GJ3YHU). KB3QM in southern Delaware claims to have worked 30! The opening had
weak but solid signals for at least an hour in this area. It moved down
the coast to northern Florida eventually. See Bill's "World above 50 MHz"
in October QST for more details. He also worked GW during this opening.

These openings all started as soon as the Gs could fire up, and on the
earlier one, at least, one of the Gs phoned this country before their
legal starting time to alert the W gang that the band was open.

Bob, W3OTC

The FCC has just ruled that local governments can't impose unreasonable
restrictions (via their zoning powers) on ham antennas. They said that
zoning restrictions would be limited to those that would still "reasonably
accomodate amateur communicates and represent the minimum practicable
regulation to accomplish the purpose of the local authority". The
particular case in point was a rule in Cerritos, Ca., that limited
the total number of antennas to three per property and also restricted
their type and size.

A similar ruling is under consideration for satellite dishes.

To Phil Biehl and other interested parties:

Subject: receiving and using the 60 kHz WWVB transmissions

I have a home built WWVB rcvr that I have been using for about 10 years with good success. My location is near Chicago. A couple years ago, NBS worked on their WWVB transmitting system and the signal strength improved here greatly.

In order to use the signal as a frequency standard reference, you have to use it directly, so to speak. What this means is that you cannot use a superhet type design where the signal is mixed to another frequency by a local innacurate oscillator, so the receiver I use is a TRF type.

I am not sure where the schematic of my unit is so a lot of what follows is from memory.

The best antenna is a shielded tuned loop. Mine was made by winding about 22 turns of 22Ga plastic covered wire around a waste basket (about 3 feet diameter). The electrostatic shield was made by wrapping the loop in tin foil. The shield is connected to one side of the loop which is the ground side of the loop. Remember that the loop must be broken and not grounded at both ends or it will act as a shorted turn. The break in the shield can be either at the center or one end (it's not critical). The loop is tuned to 60 kHz with approx 2000pf mica cap. Tune it like you would a toroid inductor for audio: connect to a signal generator thru a 100k resistor and use a scope to monitor the signal across the loop.

The loop feeds a 2 stage (FET/PNP) amplifier which is in a metal box. The output is from a tuned circuit that provides a low impedance output to the coax. The 12 volts to run the preamp is fed up the coax from the rcvr. The rcvr itself is several stages of J-FET tuned amplifiers using 1 mh inductors which finally feeds some untuned stages to build the signal up to TTL level. At the rcvr input I use a 60 kHz crystal

as a filter which makes the bandwidth 1 or 2 Hz. While a narrow filter
is not absolutely necessary (especially if you are in a strong signal area),
it really helps. (H-P used a 15Hz wide mechanical filter in their VLF rcvr).

I can provide circuit dwgs to anyone interested. Were I to do it again,
I would certainly do some things differently. I have a much better preamp
circuit (also simpler) and I would probably use a PLL chip as the main
rcvr gain block.

There have been articles in ham publications regarding WWVB and using the signal
but I disagreed with many of their techniques.

It is best not to use the 60 kHz signal directly as a counter time base
since the rcvd signal has jitter on it. Also there is the diurnal phase
shift as well as the intentional phase advance/retard each hour which
is used as their "ID".

Commercial systems use the rcvd signal merely to compare a local "house"
standard against. Comparison is done over a fairly long period (like days)
for best results, or in some cases, continuously by observing the comparison
on a chart recorder.

My system consists of a 1 MHz oscillator in a proportionally controlled oven
as the house standard. This osc is used as the time base for my counter, clock,
and synthesizer. The 1 MHz osc is also divided by 10 to 100 kHz.
The 100 kHz local signal is then multiplied by 3 using a tripler
circuit (made using a padded down 455 kHz IF transformer), squared up again,
then divided by 5 (1/2 of a 7490) to provide my locally generated 60 kHz
signal. This and the rcvd signal are both fed into a comparator, which is
nothing more than a TTL flip-flop. One output of the flip-flop has a lowpass
filter on it which gives and average DC voltage reading related to the duty
cycle of the 60 kHz square wave. This DC voltage is observed on a voltmeter
and also feeds a chart recorder running at 4 inches per hour. Fine corrections
to the 1 MHz osc are made after observing the chart after a day or two to see
the trend of drift. The present 1 MHZ osc needs some work since it is slightly
affected by room temperature changes, however it does maintain an accuracy
of at least 1 part in 10 to the 10th. The oscillator control is by a 10 turn
pot with a counter dial which controls the bias on a varactor diode in the
crystal circuit. The osc ckt is made from dual gate FET's and buffered twice
within the oven.

The loop antenna is mounted in the attic. Tests showed that it worked just
as well in the ham shack, which is below ground level (but who wants a big
loop in the way). One stage of the rcvr (prior to limiting) feeds an "S"
meter to observe the signal strength.

I also added an AGC circuit to detect the 10dB amplitude shifts which
contain the BCD time code. I have not yet attempted to build a time
decoder. At this time I divide the 1MHz down and feed a standard digital
clock using a National clock chip (5314 maybe). So far the clock remains within
one second between CST to CDT time changes. The clock and osc run off a

4 amp/hour 12 volt nicad if power fails. The rcvr/comparator run off the charger/supply.

Would like to discuss the topic further with anyone interested and will be glad to furnish dwgs of my setup to those REALLY interested. Locally I am called "Bunky Bob's Batavia Bureau of Standards".

Using WWVB as reference sure beats using WWV on HF as a frequency standard. At my location, the BEST results that can be obtained on HF are 1 part in 10 to the 7th.

I showed the articles from the GEARVAKF newsletter to a friend of mine (Bill, KA9HVU) and received the following response which may be of use to others:

"Yeah, I got the eye in my 430, but the author of the article is in dire need of training in modification applications. The job was much easier than I had expected, but I made some changes in the suggested proceedure. Removing the meter was quite simple with the aid of a MOTO-TOOL and a cutting blade. As for the bezel, it was easily cut with a deburring tool in an electric drill. I had a nice, almost new bezel in the junk box so cutting a new one from a SUCRETS can was not necessary (this also saved having to paint). The filament transformer is larger than I would like for a neat appearance, so I have it hung from the wires behind the rig - out of sight. This, however, limits the use of the 430 in the mobile which I ain't done yet."

Bill also gives some advice on preventing the explosion of the 2 meter band:

"A simple way to prevent the possible explosion of the 2 meter band would be to relieve the pressure that continues to build. It seems to me that a small

penetration of the band sufficient to release some of the pressure, but not so large that it would allow the escape of some of the 2 meter frequencies, would solve the problem nicely. The best place to make the penetration would be at the band edge where it could be closely monitored just in case it would start to tear and grow too large. As for a means of penetration, a shaft of suitable size with the ability to enlarge or shrink itself, and with a vent hole through its length could be inserted and left as long as necessary. The elastigmity of the band should prevent the escape of the shaft and if the vent was no longer required, then the hole could be plugged."

And apparently private is private.

I had occasion to hear Sen. Gore's legislative assistant who wrote the changes to the communications act of 1934 that authorized reception of unencrypted cable feeds at a seminar at MIT. It was quite clear from the discussion that the mood in congress is to regard receiving any private radio transmission as strictly illegal, including such almost public things as network backhauls and the portions of network feeds to affiliates that aren't meant to be put on the air. The general legal situation was summed up: the satellite television viewing act created "a small and very carefully defined exception" to an otherwise absolute prohibition of reception of private communications. And further, the philosophical justification was not that cable TV feeds were a special case of private communications that could be made public because that served

a public good but rather that they were somehow not really private because of their broadcast nature and wide public distribution.

It seems clear that Sen. Leahy and Rep. Kastenmeier, who have filed a bill extending 2115 to cover most classes of radio transmission other than broadcast (including cordless phones), reflect a powerful sentiment in congress. It seems quite likely that receiving anything other than broadcast transmissions intended for general use may soon become major federal felonies. I have yet to take the time to read the text of their bill so I do not know whether it applies just to point to point or similar communications or whether it would apply to all non-broadcast radio communications such as police, fire, news crews, aircraft, ambulance and other such things so beloved of the millions of Americans who own scanners. It definately extends protection to data and record communications, however, and thereby closes that loophole in 2115.

I suspect that if a broad bill covering interception of almost everything sent by radio becomes law this act will be another of those unfortunate American laws that are enforced only at the discretion of prosecuters and likely will be used more as a method of harrassing and pressuring selected private citizens out of favor with the authorities than as a real means of controlling private listening. I regard such laws as very unfair because they are not uniformly or fairly enforced. They encourage disrespect for the law by making an innately private act that can never be effectively policed (and which many millions of citizens practice and accept as their right) a crime, and not only that but a crime which the law usually winks at.

After listening to the very economic arguments about scrambling cable feeds, I've come to the conclusion that the gentleman who claimed that it was cheaper to hire lawyers and lobbyists than buy cipher machines is right. Unfortunately, however, real security is only obtained by encryption. (I might add that the audio, data, and authorization side of the M/A Com Videocipher II seems to be impressively well secured - using DES, but the video is only lightly scrambled so watching pictures without sound will no doubt become common).

I am sorry to say that everything I hear convinces me that the very strong economic interests in protection of communications the cheap way (laws) will no doubt force national policy in the direction of draconian penalties rather than universal encryption. It is too bad that this approach which is more PR than substance is being substituted for a more effective cipher based one, but such is life...

What I would like to do is invite everyone to send copies of known
packet radio users in their state. This way we can obtain a consolidated
listing of all known packet users. I don't think I have every seen such
a list and this mode of transmission would be a good way to do it.
To start the ball rolling here is what I have for the state of Virginia.

Amateur Radio is getting a lot of favorable media publicity in the wake
of the Mexican earthquake. Keep an eye on your local newspaper; I just saw
one "feature" story on amateur radio and the ARRL on the AP wire.

Now all we need are ways to get publicity WITHOUT having to have a major
disaster.

Phil

<mild flame on> - with respect to these quoted lines only
  A citizen should have stronger protections against abuse than this. One
can come up with many examples of mistaken identity, personal grudges, etc.
where a citizen was abused without having done anything illegal.
  If it is legal for police agencies to get this (e.g., dialed number) info,
then let's be up front about it. There shouldn't be an "expectation of
privacy" if it is not private info. I have no objection to using a party
line - but I should be told it is a party line.

      If you want to use the W3IWI oscar program past 1985
      you have to add to the Sidereal Time table in the
      program. This is the needed data from 1985 to 1989,

      DATA 85 , 0.2766814244
      DATA 86 , 0.2760183054
      DATA 87 , 0.2753551864
      DATA 88 , 0.2746920657
      DATA 89 , 0.2767668578

The above are the Greenwich Sidereal Times on Jan 0.0 for
the years listed. I have also convereted the program to
fortran on the IBM PC. the fortran program runs 10 times
faster than the basic program.

I was reading the Hints and Kinks in May 85 QST, article on Match Your RF Probe to Your Meter. There were several things I believe misleading and possibly wng in the article and the associated Editor's comments.

The calculations given for a 11M or 10M meter are fine, except that the meters I am familiar with have a 1M resistor in the DC probe. Since these RF probes replace the DC probe, the meter no longer has a 11M impedance. Hence it seems that one calculates the proper resistance for the dividor using the 11M for the meter, but then must add 1M to compensate for the missing probe resistor. When I do that for a 11M meter, I get the probe resistor of 5.556M for which I believe there is a standar 5.6M resistor that should be close enough. The Heathkit probe I have that was "designed" for my meter ignores the 1M resistor and uses a 4.7M divider resistor also.

Also the orientation of the diode in fig 1 seems to imply that the probe will put out a positive DC voltage. However, I find that it puts out a negative voltage. My Heathkit probe has the diode reversed and a quite differnet explination of its workings. It works, and no amount of playing with fig 1 or 2 made it put out a positive voltage.

The voltage divider (fig 3) in the Editor's comments I have tried and found very unsatisfactory. The capacitor C is effectively accross the bottom resistor in the dividor. Hence the division ratio is complex and frequency dependent. I tried to make that scheme work with two fixed resistors to give a 1/10 ratio and found that the same power output into a dummy load on 80 meters gave a very different probe voltage than on 10 meters. If I remember right, it was about a 50% variation. I never found a completely acceptable way to solve the divider problem, but ran across an article which recommended making a wire twist capacitor across the top resistors in the dividor to compensate.

>it will receive signals that someone has paid to transmit.

>Your argument is specious.

Perhaps more accurately poorly phrased. Broadcast TV transmission, program material, and production are funded by people who want me to watch it and who do not charge a fee for normal home use. Many other signals are transmitted by organizations that are providing a service to subscribers who are expected to pay for that service. If I pirate that service for free then I am doing nothing to cover the costs of providing it, (what I meant by `paid to transmit'). By pirating the service I deny the provider just compensation for his costs in obtaining and transmitting the material, and also (another subtler point) his right to control who uses it and for what. I find it very hard to justify such an act from a moral standpoint, It seems to me that obtaining a service for free that cost someone many thousands of dollars to provide is theft pure and simple.

It is clear that some signals are provided for all to use, some distribute material meant for a group of specific subscribers, and some contain private material meant for one or more authorized recipiants and no one else. It is not clear, whatever the technical ease and simplicity, or the traditional American belief in "free public airwaves" that I have the moral right to use either subscription material or completely private material just because it was there. Granted there is a subtle argument about taking reasonable precautions to ensure privacy (which I strongly beleive means encryption now it is possible, relatively cheap, and does not significantly degrade signal quality), but I do not beleive one has a moral right to use information picked out of the ether that was not transmitted for one's use.

Glenn Hauser's "World of Radio" program (an interesting and wide-ranging
half-hour weekly treatment of many diverse topics all related to radio,
with an emphasis on shortwave broadcasting), is changing its broadcast
schedule on WRNO Worldwide, the New Orleans shortwave station. These
changs are effective immediately -- one went into effect this last
weekend, and the other will occur next weekend.

The GMT Saturday morning (US Friday night) broadcast is moving earlier
to avoid poor propagation and interference at its former 0430 GMT time.
It will be aired at 0300 GMT Saturdays effective this next weekend
(that is 10 PM Friday Central Daylight Time, 27 Sept 85), but will still
be on its former frequency of 6185 kHz.

The Saturday night/GMT Sunday morning broadcast, formerly at 0130 GMT,
would be preempted by football games if it remained in that slot.
Therefore, it was moved to 2330 GMT Saturdays, which is 6:30 PM
Saturday Central Daylight Time. The frequency changes to 9770 kHz.
This already became effective on Saturday, 21 Sept 85.

The Sunday GMT 1300 broadcast on 9715 kHz (8 AM CDT Sundays) remains
unchanged.

These will all move one hour later in November with the US changeover
to standard time, by the way.

Will

DL0MAR/9G showed up on 40 meters yesterday, around 7004.1, at around
2300Z. He was running JAs, listening up about 1 KHz. He then started
to listen up 5 KHz, and was working into all continents. I got him
at 2300Z. After about 10 minutes he went to 80 meters, around 3504.1,
listening up 1 to 2 KHz, working Europe and North America. The op
was Baldur, DJ6SI (I don't know why he's using a club callsign).
QSL is to DJ6SI direct. He is usually pretty good about getting the
proper permission (his 5X5BD operation counts) so this one is likely
to be good. In any case, WFWL (Work first, worry later).

The other interesting thing on 40 meters has been FT8XB, around
7011, at 0230Z or so. He sends slow (sounds like a straight key)
and you have to crank your keyer down to work him.

People trying to make voltage dividers etc might make something of the following observation: If you have an R shunted with a C as input impedance of some device like a meter or amplifier, you can make it into a voltage divider / lowpass filter by putting an R shunted by an L in series with the original RC combination. If the R values are equal then choose L so that sqrt(L/C) = R, and the whole thing will look like EXACTLY R at ALL frequencies as seen from the input, while giving a 2:1 voltage division ratio at frequencies well below cutoff. Often the cutoff frequency comes out acceptable. Cutoff frequency is of course 1/(2*pi*sqrt(LC)).

The other approach is the capacitive compensation approach, which avoids the cutoff problem but which presents a capacitive input impedance.

By this argument, there should be no 4th amendment. After all, if you're not
doing anything wrong, why should you fear a search of your house, or a tap
on your phone? Federal angencies have often been used in the recent past
to investigate legitimate political activity, rather than criminal activity.
For example, if the phone #'s of known radicals (I'm talking about people that
SAY radical things, not mad bombers) appear on my phone bill, what right
does the FBI have to know that? If they had to go to a judge and present
some evidence that I might be involved in criminal activity, and the judge
issues a warrant, then and only then should they be allowed to obtain "billing
information" or tap my phone.

Re: 430 mods -

I have found that room can be found for most any modification if one uses the following simple procedure:

Obtain from the factory a matching empty housing and blank panel, preferably painted. Saw the original unit down the right-hand side with a band saw, taking care not to saw through too many circuit board foils, switch wafers, and the like. Often this can be avoided by bending these critical items out of the way of the saw track with gas pliers or vise-grips, before commencing the sawing operation. Saw down the opposite side of the empty housing, taking off just the side of the housing if maximum space is desired, or closer to the center line if a more compact modified unit is required. Weld the new empty housing extension onto the original TS-430 housing using Heliarc equipment for best results. To avoid warping or damage to sensitive solid-state components, care should be taken to minimize overall package temperature rise, and the entire assembly should be cooled quickly by plunging it into a water bath, preferably salt water, immediately upon completing the weld.

The weld seam may then be smoothed using a bench grinder for rough areas and a disk sander for the final finish. It may be necessary to touch up the painting if a clean appearance is desired. If so, paint adhesion will be improved if an etchant such as MetalPrep (basically phosphoric acid) is painted onto the bare metal surface and then rinsed off after allowing it to etch the metal for a few minutes. Take care not to drip too much of the acid inside the equipment as it may affect circuit board and connector reliability.

With these simple procedures, the experimenter can greatly expand the space available in the 430 and similar transceivers for custom circuit additions.

to all radio amateurs bt

there is encouraging news from mexico. replies to health and
welfare inquiries sent to mexico are being received and
delivered by american amateurs. telephone service is slowly
being restored in the disaster areas, but citizens should not,
repeat not, attempt to use phone lines to call into mexico as
they are currently reserved for official communications only.
the u.s. state department is handling inquiries concerning u.s.
citizens in mexico at telephone 202 653 7959. american
amateurs are advised to continue routing all messages to mexico
through nts, the national traffic system, or through
independent nets. direct contact with mexico should be left to
the established emergency circuits. frequencies on which
organized emergency communications with mexico are already
established must be kept free of interference, and from
intrusion by well meaning bystanders. any further information
concerning this event will be announced through w1aw bulletins
ar

qst de k9eui
hr propagation forecast bulletin nr 38 from arrl headquarters
newington ct september 23, 1985
to all radio amateurs bt

if the solar flux continues through the balance of september at
levels sustained thus far, there will be a new monthly low for
this solar cycle, close to 70. even with the best months for

the northern hemisphere, the fall season, now at hand, this would mean little dx on 28 mhz, except on north south paths. considerably greater geographical coverage will be available on 21 mhz but only on daylight paths. even 14 mhz will be primarily a daylight band unless we have much higher flux levels. though propagation is improving on our lower frequencies, dx will become easier on the ears as electrical storms die down as cooler weather spreads over the northern hemisphere. our cold nights bring hot propagation on the lower frequencies except when geomagnetic activity is high. as predicted last week, we have had a rough time with high k and a indices since about september 10. no great improvement in this respect is likely until near the end of september. conditions change rapidly as surges of particles from the sun enter the earths atmosphere. contrary to what we might expect, auroral conditions can be quite severe in the low years of the solar cycle. the current trend toward high and erratic wwv k and a indices is bad news, unless you live in the higher latitudes and enjoy auroral dx on the vhf bands. american sunspot numbers for september 12 through 18 were between 12 and 18 with a mean of 9.1 ar

sept 23, 1985

Sorry but there was no DX bulletin copied here this week.
Either they screwed up or else the propagation was bad
but several times this past week when I have tried to get
W1AW at 5pm local, they were not there. Will keep that in
mind in the future.....

Microwaves *do* effect human health. Can you say "cataract"?
(along with many other things)

I think there's rather a lot of misconception floating around regarding this issue. Part of my work is in the satellite communications area so I track these issues pretty closely.

There have been a number of different legal events and laws regarding this area, and I'm not going to try specify them, but rather just explain the backround and outcome as I understand them.

First of all, the oft-quoted old Communications Act doesn't really say you can listen/watch to whatever you want. It essentially says you can receive "broadcast" signals so long as you don't divulge the contents nor receive "benefit" from them. Interpretations of this law have long held that intercepting point-to-point telephone microwave transmissions can be construed as wiretapping, by the way. I'm simplifying to some extent regarding the Act, but you get the idea.

Now, "benefit" can be defined in different ways. On one end, you might say you benefit only if you sell the signals/info you received and make money. On the other hand, it might be said that you benefit simply from enjoying the signals!

In practice, the current legal view has been shifting from a strict interpretation more like the former view towards a different concept. More and more, "benefit" is being viewed as being able to receive something for free that other people have to pay a fee to receive.

There are numerous complexities and exceptions. For example, if you scramble your signal, the current view is that you're not really "broadcasting" but really trying to do a multipoint feed to particular people. If you intended the signal for general reception, you wouldn't scramble. Laws now generally protect scrambled transmissions as being essentially "non-broadcast" entities. A recent California appeals case convicted someone of viewing unscrambled microwave MDS--but this case seems a bit cloudy and runs contrary to the general pattern--it may yet be overturned (MDS cases are often tricky, but I won't go into the details of this case here).

Now, back to satellites. The people who transmit the popular cable services say they are not broadcasting to the public--that they are providing a service for their cable system affiliates only. This view was somewhat difficult to support given that the public ended up watching these signals in great numbers on cable systems. The situation was complicated by the fact that many people did not have access to cable and had no alternative to receiving the signals

directly if they wanted to see them. This wouldn't have caused much trouble if the services had, by and large, been willing to deal with individuals. But most of them flatly refused to deal with other than cable entities, claiming the administrative hassles of dealing lots of individuals was too great. Of course, many people indeed bought dishes simply to avoid paying for cable, even when cable was available.

For a number of reasons, this restriction was eventually rejected by Congress. The decision was made (as I understand it) that most unscrambled satellite transmissions were indeed fair game to receive, but that the public viewing these indeed DID receive benefit from receiving them, since their counterparts who subscribed to cable had to pay.

The end result was the concept that you could watch pretty much whatever unscrambled transmissions you wanted, but if the signals were offered for sale to the general public at a fair and equitable price then you must pay for them. In other words, if a satellite service WERE WILLING to deal with you as an individual, and charged you an equitable fee in comparison to cable subscribers, you need to pay the fee since you are receiving benefit from the transmissions. If the service were unscrambled and refused to deal with you, then you were free to receive the service.

In practice, there are other issues involved also, and this is just my own interpretation of events--take it for whatever value you will, but I think I'm pretty close to the bottom-line facts. Right now there is some hangling between some satellite services and congressmen who supported the bills in questions over the matter of pricing. There are some claims that the fees being charged to individuals are much higher than the fees charged per subscriber to cable systems... but the services claim that this is equitable given the administrative overhead of billing and record keeping for individuals. This issue has yet to be fully resolved. Issues of scrambled vs. non-scrambled transmissions are also still somewhat hazy in areas.

Finally, I might add that I doubt very much that there would be a public outcry to repeal such restrictions. If anything, most people would probably support tighter restrictions. Most people don't have their own dishes, and pay for cable services. I suspect that most of these people (rightly or wrongly) detest the people who they perceive as getting for "free" what *they* have to pay for. In fact, if you brought it to a vote, I'll bet that the population would happily vote in many other restrictions on spectrum listening--such as law enforcement transmissions, portable telephones, etc. The mood of the country is generally conservative on these issues, so I suggest that you think carefully before trying to get the public at large involved in such telecommunications matters.

Please note that I'm not expressing an opinion one way or another about these particular issues, just passing along my understanding of the situation.

> It has always been the case that everyone had the right to receive any
>signal being transmitted on any frequency using any kind of receiver.

Not true! It is my understanding that it has always been illegal to intercept
common carrier signals, even over the radio. This has been used for years
by Microwave Distribution System operators to prosecute unauthorized
reception of their TV signals (here in Phoenix, HBO). It is certainly in
the American tradition to allow anyone to listen to anything, but it has
not been so in the law for many decades.

>I was struck with horror and disbelief after reading this message. The

Since there seem to be questions about the 12 meter band, here is a repeat of the ARRL bulletins regarding the 12 meter band:

qst de k9eui
hr arrl bulletin nr 31 from arrl headquarters
newington ct april 26, 1985
to all radio amateurs bt

the 24 mhz or 12 meter band will be released to u.s. amateurs at 0001 utc on june 22, 1985. the 10 mhz or 30 meter band becomes permanent at the same time. both bands are exclusive in the u.s., but amateurs must avoid interference to stations outside the u.s. in the fixed service. full power will be permitted in the 12 meter band. at 30 meters, power continues to be restricted to 200 watts pep. mode subbands will be as shown in december 1984 qst, page 61. the 420 to 430 and 902 to 928 mhz matters proposed in the same docket will be dealt with in a further report and order at a later date. copies of the order will be available from arrl hq. next week. please include a s.a.s.e. with your request.

qst de k9eui
hr arrl bulletin nr 46 from arrl headquarters
newington ct june 21, 1985
to all radio amateurs bt

remember that the 24 mhz band becomes available at 0001 utc june 22. general, advanced and extra class licensees may use 1500 watts pep output on the band. the cw and rtty subband runs from 24.890 to 24.930 mhz, with cw, phone, fax, sstv and narrow band fm permitted from 24.930 to 24.990. contacts made on 24 mhz do not count for field day credit ar

PAUL, MY MESSAGE WAS:

I AGREE!

I WONDER WHAT THE POSITION OF THE "VOICE OF THE RADIO AMATEUR" = THE

ARRL, IS ON THIS LITTLE EROSION OF FREEDOM.

JIM (W2OZH)

If you are interested in playing chess or discussing chess related
subjects and have an Amateur Radio license, please take note:

Starting September 3rd (US Tuesday) and every US Tuesday evening
after, there will be a CARI (Chess Amateur Radio International)
sponsored chess net on 14.267 Mhz at 0300 hours GMT (GMT Wednesday
AM). The net control station will be NI7M located near Portland
Oregon. The primary intention of this net is to serve West Coast
chess playing hams at a more convenient time than the current East
Coast and European nets, (0300 GMT translates to 8 pm PDT), but
check-ins from anywhere are encouraged.

You don't have to be a CARI member and you don't have to be a good
chess player. Hams who would like to LEARN to play chess are
encouraged to check in.

The reason for the loss of freedom to receive radio signals is due to
the fact that lawyers, if paid enough, can have any law or right
overturned for their clients. It is cheaper to pay the lawyers and
change the law than it is to put encoders on the signal. Note, the FCC
has gone on record as saying they will not licese receivers so all the
problems come under "theft of services".

But done worry. Within 5 years all TV will be digitally encoded, then
coding to restrict tapping will be very cheap, and very hard to decode
and we can forget the "freedom" stuff.

An interesting comment... which suggests that we need a net similar to this via packet radio --- with NO commercial interests. Maybe using micros as well as UNIX. Is there anything out there (in packet land) comparable to USENET?

qst de k9eui
hr dx bulletin nr 34 from arrl headquarters
newington ct august 30, 1985
to all radio amateurs bt

thanks to kb1be and the connecticut dx association for the following dx information.

st. pierre. a dxpedition by fp/k1rh and fp/w1ccn will be active on ssb and cw through september 10. operation will be on 80 through 10 meters, and suggested 75 meter frequencies are 3788 and 3795 khz. qsl to k1rh.

mauritania. 5t5sl, operated by 9x5sl, has been reported on ssb at 1700z.

madeira. dj2bw/ct3 will be active from september 1 to 15.

guinea bissau. j5wad is again active on 20 meter ssb and cw.

mali. tz6fs and tz6wc are still very active on 20 meter ssb. look for them on 14227 khz between 2000 and 2200 z.

christmas island. vk9xj and vk9xz can be found monday through friday at 1200z around 14170 to 14180 khz on ssb. also, five operators activated the club station, vk9xi.

auckland island. zl9aa will be active on 160 through 40 meters for two months.

chatham island. zl7aa is only on 10 and 80 meters.

sao tome. s92lb, luis, is still active daily on 14183 khz ssb around 2200 to 2330z. his license has been received at arrl hq for documentation purposes.

rare african. look for dj5rt, wilfred, to activate a rare african country in september. his last dxpedition was to 5x5, uganda, last spring.

ciskei. algoa branch members of the south african radio league will operate s42u from october 4 to 6 or 11 to 13 on 40, 20 and 15 meters. operation will be mostly cw, with some ssb. qsl to zs2u.

liechtenstein. hb9nl will operate hb0nl from september 15 to october 27 on all bands, 160 through meters, cw and ssb. qsl to hb9nl ar

Lets see....straight from 9/85 CQ magazine.

9H3DN (only entry from Malta)

2,602,504 total points
3,616 QSO's
104 Zones
384 Countries

Multi-Single Winners
LZ7A (oprs lz's 2he 2df, 2po, 2cc, 2ua, 1a310/2)
7,243,456 points, 4345 qso;s 168 zones, 536 countries

you won a certificate, it seems, as you're score is highlighted. Will
send a copy of the article to you.

GOOD SCORE!!

Yes it is possible, and not even very difficult.

Some years ago it was pointed out that 68 percent of long distance telephone trunks went by ground based microwave. And while the long distance carriers have been working (under some pressure from the NSA and White House) to convert these circuits to optical fibers or at least coaxial cable there are still many routes that use microwave or satellite hops. I don't know an exact figure but I think it would be reasonable to guess that at least 40-50 percent of long distance trunks include a microwave or satellite hop. And some 75% (approx) of long haul microwave relays use the 3.7-4.2 Ghz band which is readily receivable by a tvro.

Most long haul microwave systems use FM modulation and frequency division multiplexing (FDM) of single sideband supressed carrier voice channels. Some satellite systems also use this modulation. Unfortunately FM-FDM-SSB modulation is quite easy to receive with simple and widely available equipment. Recovering the contents of a specific channel is very easy, which opens up the possibility of monitoring random phone calls to a specific group of destinations or monitoring specific private line data or voice circuits (which are assigned to a multiplex slot for long periods of time).

The question of whether a TVRO could be used to monitor phone conversations has been raised on the net. The answer is that with the addition of a stable general coverage single sideband receiver (such as an ICOM R-71 or a Kenwood R-2000 or the receiver section of a modern transceiver) connected to the unfiltered and unclamped video output (provided for connecting stereo adapters and descramblers) a TVRO can be used to listen to FM-FDM multiplexed telephone signals from both celestial and ground based sources.

Further, with a stable down block down converter that converts to the UHF TV band and one of the scanner type receivers designed to cover this band one can also receive the some of the single channel per carrier (SCPC) signals that carry telephone circuits to more remote places (along with network radio feeds, Muzak, and various broadcast data services such as the AP and UPI news services). (Some signals

are dithered and require some form of closed loop afc to receive them).

This vulnerability has been well known in security circles for many years, but as the number of tvro systems has increased to over a million, the problem assumes a somewhat different perspective. In 1976 Mitre estimated that it would cost $50,000 + to intercept microwave telephone calls, and would require a 10 foot dish. In that era a 10 foot dish would attract much attention. Today one can buy a tvro system with a 75 K LNA and a 8-12 foot dish for $1000-1500, and almost nobody will give the system a second glance as tvro's are commonplace. A 75 K LNA beats a the 10-12 db noise figure receiver that Mitre based it's calculations by a very substantial amount. And the current generation of computer controllable general coverage ssb receivers is a much cheaper demultiplexing device than the synthezizer and selective voltmeter that seemed necessary in 1976.

The existance of all these millions of receivers that can pick up both celestial and ground based telephone circuits means that one should not presume that a long distance telephone call is private. And more important (because they are much easier to find in FDM complexes) nobody should assume that a private leased line is secure (unless the long distance carrier has specially routed it via lightwave (much more secure) or coaxial cable (somewhat more secure) for it's entire path. (Obviously conventional (and highly illegal) wiretaps also have to be considered if there is some reason to beleive that some individual or organization has a strong enough reason to be interested in your communications).

Background

Communications satellites carry telephone traffic in several formats. The principle formats are:

Multi Channel systems

1. FDMA - PSK - TDM - PCM.

   Used on a number of transponders on 4 and 12 Ghz satellites. Heavily used by private business for tie lines and other leased line services, sometimes mixed with data. Quite secure if encrypted. Not easily intercepted by private individuals

2. TDMA - PSK - TDM - PCM.

   Used on SBS (12 Ghz) satellites as the principle access technique. Therefore SBS Skyline service and some MCI service (they are now both owned by IBM) is protected this way. Used also on some 4 Ghz transponders. Very difficult for private individuals to intercept even

if not encrypted. Some circuits encrypted some not. TDMA is felt to be the heavy use satellite access technique of the future as it offers very efficiant use of transponder power and dynamic allocation of system capacity to those links which are currently active. When combined with encryption it is quite secure.

3. FDMA - FM - FDM - SSB.

Standard modulation used on almost all terrestrial long haul telephone microwave circuits. Used on several 4 Ghz domsat transponders and most multi channel Intelsat links. Wideband FM-FDM signals can be readily received by standard tvro receivers, and an individual channel can be easily picked out of the multiplex signal with a garden variety general coverage ssb comunications receiver. Very easy for private individuals to intercept.

4. CDMA - TDM - PCM otherwise know as spread spectrum.

CDMA or spread spectrum techniques are widely used on military satcom links because of their security and resistance to jamming. As far as I know the only commercial satcom use of such techniques is by Equatorial Communications to broadcast data streams to small (2-3 foot) dishes. Intercepting and decoding military spread spectrum signals is presumably nearly imposible even for large well equiped intelligence agencies. Intercepting Equatorial signals is quite possible, though it is reported that they will soon encrypt all the data they transmit.

Single channel systems

5. FDMA - FM otherwise known as SCPC - FM.

Single Channel Per Carrier is used to transmit one single nbFM telephone channel between two points. A transponder carries many such FM carriers at one time. Frequencies used are often coordinated by a central station when the call is set up, and may only used for the duration of the call. This technique is used for communications with remote places that rarely need more than a very few circuits at once. Can be relatively easily intercepted by a wide band scanner connected to a very stable block downconverter. Easy for private individuals to intercept.

6. FDMA - PCM otherwise known as SCPC - PCM or SPADE.

This technique is the international standard Intelsat method of establishing telephone connections between places that don't have enough traffic to warrent permanently assigned

FDM trunks. Each direction of each telephone call is assigned a channel by the central control station. Stations transmit a PSK keyed carrier on that channel for the duration of the call. Each carrier contains one 8 khz sampled PCM bitstream along with some error correction and sychronizing bits. As far as I know encryption is not used. The signal can be intercepted by a sophisticated individual but intercepting it requires a very large dish as the effective radiated power per carrier is very much less than domsat SCPC carriers use. A few domestic satcom SCPC users use PCM, probably with some form of encryption. Hard for a private individual to intercept.

7. FM - FDM - FM (Subcarriers on Video feeds)

As most TVRO owners discover, many of the video feeds contain additional subcarriers that carry unrelated or tangentially related material. Included amoung these are cue and coordination channels that may occasionally carry telephone like conversations. There are no regular telephone circuits on video subcarriers however.

On FM-FDM-SSB

All it takes to recover FM-FDM signals is a suitable wideband FM receiver connected to a stable general coverage ssb receiver that tunes the frequency range used for the baseband. Tvro receivers have the correct bandwidth for many such signals and often incorperate provisions for IF filters that can be used to better adapt the receiver to the narrow band signals found on some transponders. And modern general coverage receivers and transceiver receiver sections with synthezised tuning, digital frequency display, and narrow IF filters are well suited to recovering the audio on a particular channel.

Listening to FM-FDM-SSB signals can be accomplished by tuning the TVRO receiver to either a satellite transponder carrying a FM-FDM signal (this may involve restricting the IF bandwidth with a filter as some transponders carry more than one FDM-FM signal), or pointing the antenna at a nearby terrestrial microwave transmitter and tuning the receiver for maximum signal.

Once the FDM-FM signal has been tuned in, the single sideband receiver can be used to search the baseband (typically .3Mhz to 6 or 8 Mhz) for telephone conversations, data transmissions and other private line circuits. Individual channels will appear as usb or lsb signals at precise 4 khz intervals. In fact the whole baseband is organized into 12 channel groups, 60 channel supergroups, and 600 channel mastergroups according to a standard frequency plan (the AT&T plan as usual is different from the CCITT one used internationally)

Most channels have completely supressed carriers, although certain channels will seem to have a carrier in them (but slightly off

frequency) which is something called a pilot tone, used to monitor circuit continuity and control overall gain. Depending on how archiac the telephone trunk equipment is on a particular trunk, it may have a 2600 hz sf signalling tone in it when it is idle which is dropped when the channel is in use for a call. Trunks which use sf signalling also often use MFKP (multi-frequency key-pulsing - the famous blue box version of tone dialing) to pass telephone numbers on to the destination switch. More modern trunks use CCIS (common control interoffice signalling) which is a packet network replacement for the earlier and less secure in band signalling that uses separate signalling channels to carry all the signalling for all the trunks in a trunk route.

Obviously, a single signal usually carries only half a telephone conversation so it is necessary to use two receivers and TVRO's to pick up both sides of the call clearly. Receiving both sides of a terrestrial circuit requires a suitable location where both directions of transmission can be picked up, which usually means a site in line with the microwave path. Sometimes both directions of transmission from a repeater site can be monitored by a very nearby (less than a mile) receiver. Many telephone trunks have low enough echo return loss so that both parties can be heard even on when monitoring only one direction of transmission however, so it is quite possible to listen to both sides of some conversations with only one receiver. Both sides of a satellite FDM circuit can usually be found on the same bird but are sometimes not, and sometimes not even on FDM satcom at all.

In general, particularly on terrestrial signals, all the channels in a 12 channel group originate and terminate at the same place. The groups and supergroups that make up a mastergroup however often originate from several different places. Demodulation to baseband audio is generally done as few times as possible on a trunk or private line circuit that connects two places, the 12 channels of it's group are shifted to various frequencies within the baseband of the different satellite, microwave or coaxial cable FDM signals that carry it to it's destination, but at least with older multiplexing equipment the granularity of routing resolution is a usually a group (occasionally half a group), and all 12 of the channels in a group usually end up demodulated to audio at the same place.

Channels within a group are assigned to various purposes. Some may carry telephone trunks, some may carry private line data, some may carry private trunks that belong to large companies, and a certain percentage are reserved for use as spares. It has long been telephone company practice to route the telephone trunks between two switching centers over several different paths to supply redunancy in the event one path fails (and also to make it harder to intercept a particular call between the two switches). This means that any given FDM group may contain trunks from several different trunk groups rather than containing all the trunks from say Chicago to West Bend.

On PSK TDM

The most secure technique in commercial service, and probably

the technique that that will predominate on satellite links in the future, is TDM-PCM (time division multiplexed pulse code modulation) either phase shift keying (usually QPSK) a continuous carrier on a transponder that may have several such carriers on it (FDMA - frequency division multiple access) or keying a single carrier that occupies the whole transponder in bursts precisely timed so as to not overlap other carriers from other stations that it shares a transponder with (TDMA - time division multiple access).

Telephone traffic on TDM-PCM links is sampled 8000 times a second and converted into 8 bit binary values (in a sort of floating point format called A-law or u-Law companding that greatly expands the dynamic range from softest to loudest that the channel will handle). (There are other digitizing standards used on satellite phone links but the standard T carrier - D channel bank is widely used). Some number of these channels (often 24) are combined into a high speed serial bit stream (often 1.554 mb/s) by sending one sample from each channel in serial form as a string of 8 bits followed by a sample from the next channel and so forth. Sometimes this composite bit stream or the bit stream from individual channels is encrypted with a DES chip. Error correction and framing bits and sometimes special control channel bits are added. This digital bit stream is then scrambled (so it has more predictable transition statistics and little or no DC component) by a linear feedback shift register sequence. The resultant bit stream is used to PSK modulate a carrier which is uplinked to the satellite.

Receiving these FDMA-PSK-TDM-PCM digital transmissions requires complex rf modems, a large enough dish to get an acceptable signal to noise ratio (and BER), and often requires knowlage of the DES encryption keys used (unless you are a major intelligence agency and can break DES). While some such transmissions that aren't encrypted could in theory be monitored by a very sophisticated individual, particularly one who had access to the rf modem and multiplexing hardware used by the subscribers, the required expertise and technology is great enough so few if any such listeners exist. Presumably the only listeners to such transmissions are the intelligence agencies and perhaps industrial spies who can afford to buy the necessary hardware to listen to their competitors private circuits. And more and more users of such links are encrypting them with DES.

TDMA-PSK-TDM-PCM signals are much more complex than most FDMA-PSK-TDM-PCM signals. This is natural since all traffic is transmitted by having each station on the network transmit a burst of very high speed (tens of mb/s) data in an assigned time slot round robin fashion. Included in the burst is all of the traffic that station has with every other station on the network. Every other station monitors the all the bursts from stations it is in communication with and picks out the channels that correspond to it's incoming traffic. In many such systems burst lengths and time slots are dynamically assigned by a master ground station computer as calls are set up and terminated. Each station is capable of receiving and decoding the bursts transmitted by every other station it talks to, so if the channels are not encrypted it could monitor much of or all the traffic going through the transponder. In practice, however, the complex firmware and hardware make it difficult to accomplish this.

The burst formats are complex and contain error correction, status and control channels, call setup channels and so forth. And the bursts are scrambled just as in the continuous carrier TDM case. Intercepting and demodulating such a signal would be a major task and is probably something that has only been done (by intelligence agencies) by using perverted versions of the ground station hardware and firmware used by the system. In addition to the complexity of the task of sorting out the digital information and finding the right time slot from the right burst to retrieve the channel of interest, the very high speed fast lockon rf modems used to demodulate the bursts are themselves non-trivial devices. I suspect that even perverting the firmware in a legitimate ground terminal is complex enough so that no private individual or group could easily accomplish it without access to a lot of detailed non-published information (such as source of the firmware and precise details of the protocol and burst formats).

It has been said that SBS which uses such TDMA techniques on it's 12 Ghz system regards the signal format as complex enough so encryption is not necessary for at least some of the traffic it transmits. I doubt very much if a private individual has ever successfully monitored telephone traffic through this system (except perhaps by fiddling with a legitimate ground station).

Regarding the 40 meter RFI problem, I don't have any difficulty on 40. However, you should see the light show on my H-19 terminal

when I tune up toward the top of 80. Really fancy. Also, my
hard-disk drive does a dance or two at the same time. The comment
about the US Robotics modem also applies here on 80.

I am running a Galaxy III (300 w pep) into an inverted V (sort of lazy
inverted v). I fail to have any problems on any other equipment:
phones, other computers, etc. In fact, I have another Z80 machine
sitting right next to the rig (also 4mhz clock) and it NEVER suffers.
It is, however, far more sensitive to glitchy power. Makes no sense.

I have been running with the new WA8DED v 0.9 TAPR code in one of my
TNCs for a couple days. It is amazing to watch all the protocol
errors being committed by the original TAPR code. Easy to see with
the improved monitor mode of WA8DED's stuff.

This has no bearing on the legality/illegality of satellite reception,
but I am miffed at the attitude of TBS, ESPN, etc, that satellite dish
owners should pay for the privilege of viewing the commercials that
they carry.

I can understand the commercial-free services like HBO being upset, but
TBS, ESPN, MTV, etc appear to me to be similar to ABC, CBS, and NBC in
that they carry commercials to cover their costs.

But then, I'm also miffed that PBS thinks I should "contribute" to the
local station so that they can show commercials too. By the way,

why should they now have the privilege of using the channels which the
FCC had reserved for "non-commercial use only"?

I guess the commercial networks were right when they claimed, ten years
ago, that "pay TV" would simply be charging for the same services that
were already available on commercial broadcast "for free".

It should be pointed out that monitoring telephone conversations
from either terrestrial or satellite links would almost certainly
be construed, under current law, as wiretapping. This is,
I believe, a federal crime (probably a felony), and not to be
taken lightly.

The Communications Act doesn't say you can't listen to whatever you want. It does say:

"Section 605 ... No person receiving or assisting in receiving, or transmitting or assisting in transmitting, any interstate or foreign communication by wire or radio shall divulge or publish the existence, contents, substance, purport, effect or meaning thereof,...to any person other than the addressee, his agent or attorney...or in response to a subpoena issued by a court of competent jurisdiction, or on demand or other lawful authority...and no person not being entitled thereto shall receive or assist in receiving any interstate or foreign communication by wire or radio and use the same or any information therein contained for his own benefit or for the benefit of another not entitled thereto...This section shall not apply to the receiving, divulging, publishing or utilizing the contents of any radio communication, which is transmitted by any station for the use of the general public, which relates to ships, aircraft, vehicles or persons in distress or which is transmitted by an Amateur Radio station or by a citizens band radio operator."

As long as you don't divulge, the Communications Act does not prohibit you from listening to anything. Further, the Act only applies to interstate and foreign communications. Thus, a point-to-point link within one state is not protected at all by the Act. Nonetheless, anyone with some listening or operating experience can tell you that radio transmissions don't really care about political boundaries.

Finally, upon this reading of Section 605, I noticed that the Act doesn't prohibit a scanner listener from telling his friend that he just heard about a fire or some other life-threatening situation. After all, those are radio communications relating to persons in distress.

Fortunately it is not wiretapping. Since it is on the open airwaves,
a different set of rules take over. You can receive the signal, you can
listen to it, but you cannot tell anyone the contents of what you heard.
It is exactly like listening to police/fire. You can, but don't tell
anyone the contents of the communications.

If you are interested in playing chess or discussing chess related
subjects and have an Amateur Radio license, please take note:

Starting September 3rd (US Tuesday) and every US Tuesday evening
after, there will be a CARI (Chess Amateur Radio International)
sponsored chess net on 14.267 Mhz at 0300 hours GMT (GMT Wednesday
AM). The net control station will be NI7M located near Portland
Oregon.   The primary intention of this net is to serve West Coast
chess playing hams at a more convenient time than the current East
Coast and European nets, (0300 GMT translates to 8 pm PDT), but

check-ins from anywhere are encouraged.

You don't have to be a CARI member and you don't have to be a good chess player. Hams who would like to LEARN to play chess are encouraged to check in.

The $350-$500 Stargate project hardware that Lauren Weinstein (sp?) is working on would be quite useable here; don't cha think?

I believe that you overrate the expense and difficulty factors; but, I can't see any reason to do most of this listening even though it would be quite easy. BUT; with the downlink from Usenet on WTBS's subbands and free, there is a very real probability that I will obtain one of Lauren's boards to go with my tvro setup and my (as yet imaginary) general coverage receiver and my MacIntosh...

[Ring.... ring...]

I don't know where you are getting your law advice from, Lauren, but
it is NOT illegal to listen in to the phone calls that are transmitted
over the satellite or ground microwave repeaters. It WOULD be illegal
to discuss what you heard with another person, or use the information
to your benefit.

Only partially right, Captain Video.   Wiretapping is different from the
communications laws (by the way, is the topic of discussion and your point
is only one of the opinions on how that law works). By your own reasoning
if I put a big coil around the the telephone line coming out of your house
and inductively pick up your signal, then it isn't wire tapping either, which
is not the case.

Not that I'm necessarily supporting this interpretation, but as
I explained earlier the courts have been interpreting the word
"benefit" rather broadly--that's the basis for the new restrictions.

Also, most point-to-point transmissions are covered by various
court interpretatons of the Act into "wiretapping" protection
areas.

Remember that the Act alone doesn't define the state of the law--
the way the COURTS interpret that act and build up case law does.

If you're not a hardware person, you might as well stop reading right
now. This is being sent to the above strange combination of lists
because I have no access to UUCP's net.electronics. If some kind soul
could forward this message there as well (once only!), please do.

I'm going to be driving a large hunk of coax with taps off it with FM
multiplex stereo. The cable already has normal video RF on it; I
intend to modulate in the normal broadcast FM band, between channels 6
and 7 (88 to 108 MHz). The idea is to have a private FM stereo
network that anyone with an FM receiver can listen to off the cable
(analogous to cable TV, which is already on the coax).

Unfortunately, I'm not an RF engineer, and my interest in *analog*
high speed circuits was a) as a hobby, and b) quite some years ago.
Hence, I'm very out-of-date on how to drive such a beastie. There
must be a better way than the many-discrete-components ideas I can

generate.

What I want are references to schematics which would show how to do this. The lower the cost per transmitter, the better. What with stereo FM on videotapes now, it's possible that someone's made a chip to do the modulation, now that consumers might be generating FM. (I *know* the demodulators are a dime a dozen. This is different.)

If there does not exist a chip around somewhere, I'd appreciate pointers to recent articles on building cheap stereo FM transmitters. The ideal transmitter would be one whose transmit frequency can be programmed with a DIP switch (i.e., a synthesized transmitter that divides down the carrier and PLL locks it to a crystal).

As a part of that last piece, I'd love to hear about divide-by-n chips that are programmable from 1 to 256 via some eight-bit input, and can divide down an input frequency of 110 MHz or lower. If no such exist, I can take a slower part and put a fast flipflop in front of it, hence making even 50 or 25 MHz parts usable but inferior to one that's really fast enough. (This may not be a big problem, though, since 64 different frequencies is plenty given recommended transmitter spacing and the width of the band.)

This *must* be a solved problem. I'd hate to reinvent the wheel, whatever I do. Can anyone point me to the relevant literature? Please reply directly to me, since I'm not on all of the above lists, and hold CC'ing the list unless you think it's of general interest.

Thanx much!

Not to justify their actions, but at least some of the commercial-laden
services aren't all that happy about doing scrambling, but are having
their arms bent by others. In particular, the sports suppliers are
upset about not having control over the markets in which things run
(they already demand that some cable companies black out some programs,
but they can't do that with TVRO people). Also, the copyright holders
of most movies and old TV shows are starting to get very testy. They're
demanding a cut from everyone watching those old programs. What makes
satellite transmission of "The Munsters" different than watching it
on a local station?--the answer is easy: When a local station buys
a program like that, they pay a fee based on their market share. If
you're in LA or NYC, it's a big fee, since they're the two biggest
markets in the country. But if you run your operation out of a smaller
city... like Atlanta (WTBS) or WOR (Secauscus, NJ) you pay much
less than a station in LA that only sends to the Los Angeles Metro area.
Yet, these satellite superstations like WTBS, WOR, and WGN are sending
to the entire country, not just one city! The program suppliers feel
that they're getting cheated by not being able to charge the kind
of fees that they would for conventional network airing.

There are other complexities, but the end result is that there is
considerable pressure on many of the non-pay operations to
collect some fees and send them back to the program suppliers and
copyright holders.

Some services will never scramble. You should always be able
to watch TBN (blechh!), University Network (Dr. Gene Scott--
very interesting at times), C-SPAN, etc. But so long as there
are copyright holders who want a piece of the pie, even the
non-pay operations will be under pressure to scramble.

On the other hand, as I reported in another list recently, the HBO
scrambling experiments are having serious problems (MA/COM $400
decoders, DES audio encryption) and the industy is sitting back
to see how HBO comes out before they make initial moves in the
scrambling direction.

Carefull. The networks may be 'free', but at least HBO, etc, doesn't
cut up the movie and insert commercials or cut out the juicy bits.
They may be free, but they are prudish.

For Sale: Ham Radio Station and Oscilloscope

PRICE SLASHED!

Icom IC-720A transceiver with narrow CW filter
Icom PS-15 power supply
Icom IC-SM5 desk microphone
Icom hand-held microphone (not used for mobile operation)
AEA AMT-1 Rtty/Amtor computer interface
Astron RS-7A 12 volt dc power supply (for AMT-1)
Hustler vertical antenna (80, 40, 20, 15, 10 meters)
Heath IO-4105 oscilloscope (5 MHz, single trace)

The transceiver is in very good condition and has never been used for mobile operation. The oscilloscope is in mint condition because it has received practically no use since construction (it was certified by Heath as in perfect working order). The AMT-1 will work with most microcomputers that have some kind of terminal program for communicating with other computers.

I prefer to sell everything as a package for $1150.00 (I'll pay the shipping), but will consider offers for separate items.

Call me at 312-962-6091 (Mon - Fri, 8:00am - 4:00 pm CST) or 312-947-9544 (Mon - Fri, 5:30 pm - 10:00 pm CST, or all day on weekends).

Somewhere I have heard that if even a PART OF a transmission goes over
the phone lines, then tapping in has been construed as wiretapping.

re: "... Within 5 years all TV will be digitally encoded ..."

No way. Not in 5 years. Not in 10 years.

Explanation: Sorry. What was meant was that all satellite TV in the
feeder channels would be digital. A conference 2 years ago standardize
the TV digital code for exchanging pictures between nations. I agree
that local home TV will not be digitally encoded in the near future. We
will go to the 1025 line system probably with 2.5/1 aspect ratio first.
Since Panasonic has a total digital TV set that can accept any TV
standard, 525,625 and 1025 line, and deliver a 1025 line picture, the
switch to, possibly, a totally digital TV on cable and satellite may be
very soon. I agree that on-the-air local TV may be considerably delayed
in the switch.

As far as I know, the laws on wiretapping and wire fraud do not require
that the material actually be on a wire. Intercepting of telephone
conversations off of a point-to-point microwave transmission
is apparently legally considered to be wiretapping. I believe that the
same case law will cover telephone coversations on satellites.

Over the years I've read of a number of cases of successful
prosecutions of people who were monitoring microwave sidelobes
for telephone conversations. Felony convictions as I recall.

It's amazing how naive some people are about communications issues.
The Communciations Act doesn't create the entire universe. It is
subject to interpretation by the courts, interaction with other
laws, and the buildup of case law over time. The intersection of
all these aspects create the current legal environment. Simplistic
readings of the Act will almost always be in error when it comes
to real world cases.

The Stargate hardware doesn't include a TVRO! It's decoding and
buffering equipment for the particular vertical interval signals
on which Stargate resides. It has nothing to do with receiving
other sorts of signals.

By the way, just to correct a point of fact--the service (if it ever
becomes a service as opposed to an experiment) won't be "free"--there
will have to be some (hopefully quite modest) monthly fee associated
with the service. The data (due to the very design of the vertical
interval system) will already be pretty heavily scrambled. Some
sort of fee is absolutely necessary since we are NOT being given
the channel bandwidth in the vertical interval for free forever!

At such a time as we go into a service mode, then we're going to
have to pay the uplink people for the use of that bandwidth. Luckily,
since they consider Stargate to be an extremely interesting and unique
"electronic publishing" non-profit-type project, we will be
paying fees much, much less than what would normally be the case.

[....]

I have found that I am listening to my satellite dish much more than
watching it lately. I suggest anyone with a dish get off Galaxy I
for a while and listen to Keith Lamonica on Telstar 303 (a couple of
degrees East of where Comstar D4 was), transponder 18. The program
is a "call in" type and really generates some interesting conversations.
He is on each evening from 8:00 P.M. central time until 10, 11 or 12,
whenever things die down! On Sunday evenings, he is starting to have
video, although I think I like just the call in better.

I would like to hear from any other individuals who have been listen
to him... If you value your _RIGHT_ to own and operate your own
Earth station, I suggest you listen in!

Happy dish fishing!!

>This has no bearing on the legality/illegality of satellite reception,
>but I am miffed at the attitude of TBS, ESPN, etc, that satellite dish
>owners should pay for the privilege of viewing the commercials that
>they carry.

Doug,
     Have you been to a movie lately? The last time I went to the
theatre, I paid 5 bucks to sit through 15 minutes of commercials before
the movie started. The pay TV folks are no different.

Though the plain long-wire (or "inverted-L" or "random-wire") antenna
usually works best for general SWLing, there are others, like the trap
dipole you mentioned, that are better for the shortwave broadcast bands
or for certain physical facilities. There are quite a few ham-oriented
books on antennae, but for the SWL, they spend too much time and effort
on models that handle the power of a transmitter feeding through them.
For the cost of a couple overseas postcards, though, you can get some
info from a couple good sources:

The BBC's "Waveguide" program this week just discussed a new leaflet
they are printing called "Aerials", which is an introduction to the
subject. They also mentioned that their engineering staff has a separate
antenna-information booklet or handout. Ask for both of these by sending
a postcard to:

Waveguide
BBC World Service
Bush House
London, England (there is a postal code, but I don't know it; this
                 work OK as is)

Also, Radio Nederland has a lot of printed material on antennae, radios,
DXing, etc. Ask for their info on antennas, and also ask for the
Receiver Shopping List and the Publications List. Write to:

Media Network
Radio Nederland
PO Box 222
Hilversum, Holland (again, I think there is a postal code, but this will
                    do by itself, I'm sure, even if there is)

Myself, I've always used the simple longwire; I've never had a house
where the layout of the yard allowed erecting a [somewhat] directional antenna
(like a trap dipole) in the right direction to optimize reception of
what I was most interested in receiving.

Regards, Will

Sorry, I gotta disagree even with your clarified comment.

I see no evidence that the conventional cable satellite services
have any desire to convert to digital systems. Perhaps a premium
service or two may play with high-resolution systems, but even
that is questionable in terms of economic viability.

Remember that once scrambling is in place and people are buying
descramblers, those millions of TVRO stations represent a significant
commercial market for the carriers and their advertisers/operations.
I don't expect to see digital TV transmission make signficant inroads
except possibly in international traffic, where the number of
transmit/receive points is fairly small.

Another issue is the extreme unwillingness of most cable systems
to make new capital purchases for their systems (say, for digital
TV equipment) unless it has immense immediate profit.

Digital TV may leak into the marketplace over time. But given
the inertia and marketplace (and even political!) pressure of
the 10's of millions of people (and cable companies) with
conventional equipment, I expect the process to be extremely
slow except in very specialized situations. The time scale?
Maybe 10-15 years. Maybe longer.

Frankly, I am miffed at the FCC's asinine position which still segregates spectrum space into "educational" and "commercial." Remember when all the NYC V's bought out Channel 13 and made it WNET. Nothing like buying off a competitor, right? Now, I hear from very reliable sources, that they are running ads stating that you can get "thirties on Thirteen." Imagine that, a PUBLIC TV station selling "sponsorships."

Then there are those religious broadcasters who run essentially paid religious broadcasting (soliciting donations) in both parts of the FM band. (See my recent flamage in net.music about this...down boy...down!)

Then there are those jerks who are lining up to get a UHF station in your town, radiate 3 watts out of a plastic coathanger on top of a Hechinger's TV antenna mast pole, and whine and complain about "must carry." To hell with must carry! My cable system has excess capacity of 30+ channels! I wouldn't mind getting a real NBC Affiliate in Charlotte (WXII Winston Salem... Cablevision of Charlotte, are you listening?). After all, you can get PTL club on our cable system on 5 different channels. Is this diversity?

Speaking about educational TV and radio, I think the FCC should take a very long and hard look at monopolizing of channels. For example the State of North Carolina has 8 (count em, 8) public TV stations which do a fine job, thank you. However, they all operate with less than maximum facilities (like 300 kw visual) on UHF. Educational broadcasters should not be given carte blanche in spectrum utilization, but rather be encouraged to use MAXIMUM TOWER AND POWER to reach their viewers. I can't believe for one minute that it costs more money to put up one 5MW UHF station in Clemmons, N.C. to cover what channel 17 (Linville) and channel 26 (Winston-Salem) does now! And, I don't feel one bit sorry for their complaints about money when UNC operates channel 58 Concord, NC and someone else operates WTVI (42) Charlotte... not to mention the public TV station in Rock Hill. Can you imagine what a conniption fit the FCC would raise if, say, channel 45 in Belmont and channel 3 in Charlotte (equally as close) were both CBS Affiliates ?

Segregation of the ether has had exactly the effect which Netwon Minow said: it turned commercial TV into a vast wasteland. Knowing that their brothers below 92.1 mHz and on the "*" TV channels would take care of "culture" and "limited commercials" and "no editorializing (hmmmm?)" the major networks were given free run over their affiliates to bring us such wonders as a Double Shot of "The Lone Ranger" and dreck like "Sliver Spoons".

I've no objection whatsoever to the programming or ideals of public TV

and radio. What I have an objection to is the segregation of the ether that serves no purpose whatsoever but to perpetuate 80% of the FM band being the RFI that it generally is. I also violently object to those fundraising campaigns that public stations feel they need. Until our local public FM station stops compressing the crap out of classical music, I think they should send ME money, so I can build my basic repertoie collection and listen to music the way it was performed in the first damn place.

(Gosh, this feels great!)

    It seems that I remember a case involving a youth who intercepted a wireless telephone call from a neighbour. This kid evidently was able to pick up one side of the wireless phone call because it was above the AM band. The subject of the calls were arrangements to purchase and distribute cocaine. This child told his mother, who called the police; which in turn spent several more days listening. THIS WAS NOT HELD TO BE WIRETAPPING because the radio facilities were not common carrier but part 15 devices. They got a conviction (and one of the principal defences of the coke trafficker was that it was an illegal wiretap).

Interception of common carrier telephone facilities, wire, coax, microwave, satellite, whatever; I am assured by a prominent Washington attorney, is technically wiretapping.

David Anthony

In answer to Jerry Ruhno (my mail system doesn't like your address so I'm sending this to the full distribution list):

I recommend that you continue to use your longwire, string it up outside in the clear and get a simple antenna tuner (MFJ makes one for ~$35). This should do as well as a trapped dipole on the bands the dipole is tuned for and better elsewhere. You'll have to twiddle two more knobs for optimal reception but it's worth it.

I'd be interested to hear your opinions of the 2010 by the way (especially the performance of the synchronous ECSS).

Lines: 24

Last Sunday evening I was in darkest Eastern Shore Maryland, coming back
from "the shore" and tuning across the FM BC band. I discovered French-
speaking stations strong enough to cover up the Washington/Baltimore
stations on 88.5 and 89.3 MHz. Since there is no station here on 88.1 (except
a 10 watter), the Canadian station on that frequency was Q5. I didn't
get any calls, but they did mention Montreal, etc.

I have tried to find a frequency/power/location listing for Canadian FM
BC stations without luck. The 1985 Broadcasting Yearbook is hopeless.
The World Radio Television Handbook (about 1983) is worse. Can anyone

suggest a current reliable source?

This experience was especially frustrating since I was 2 hours from home
and SURE that 6 and probably 2 were open for sporadic E propagation.
In fact they were, and someone worked Spain cross-band 6 to 10. The
Spanish aren't allowed on 6.

Thanks in advance.

You don't mean channel 9 from Atlanta, you mean channel 9 from
Chicago (WGN). In any case, the current status is that the carrier
owns the vertical interval, not the station.

I have an oppertunity to pick up a used YAESU FTDx400 tranciever. I would appreciate any information regarding its good and bad points as well as estimates of its dollar value. The rig I am looking at does not transmit, the final amp heaters do not come on. The reciever works and i like it better than the National NCX-3 I have now. I am assuming that i will be able to fix the transmitter. The rig includes a matching speaker and external VFO. Thanks in advance for any information;

JIM (KY2D),

Having gone through the removal of a roof mount similar to the one you describe I would suggest the following:

1. Purchase some HARDWOOD doweling the size (or slightly larger) than the holes left by the screws.

2. Bore out the holes to ensure a snug fit for the dowels.

3. After covering the dowels with roof tar, drive them into the holes.

4. Then liberally apply additional roof tar over the dowels.

NOTE: If you drive the dowel in too low water will have a tendency to puddle over the dowel head, therefore, it is better to leave about 1/4" dowel above the roof line.

I learned the above through personnal experiance, and now sleep in a dry

bedroom.

Good Luck,

73's
Rich (WA6PEZ)

All North American AM and FM band broadcast stations (as well as
TV) are listed in the excellent "North American Radio and TV
Station Guide" by Vane Jones, available most anywhere that
carries Sams books. Or you can buy it directly from Vane Jones
in Indiana. If you want his address, I will put it on the net.
The book lists lots of useful information for the BC DXer
(day/night power, networks/formats, impending frequency changes,
etc) without being cumbersome or expensive.

Hi Rick.

..

Guess I had better get into this roof mount tower bit as I have had lots of experence in this.

When I was in the army (22 years) we were always moving from place to place, many times in government quarters. There was very little you could do when it cant to installing anything even semi-permanantly.

I took a 10 ft roof mount tower section, bolted the legs to 2X8s 10 ft long. Then I manhandled it 'till it was straddle the roof peak. Then I guyed the tower to each roof corner (4 times). Then I put a 15 meter beam on a 10 foot mast section (with a rotor) above the tower, plus a 6 element 2 meter beam 5 ft above that!!

Next I guyed from the rotor to the same place the tower was guyed. Now this sounds like a huge mass (not mess) not to bolted down, but by keeping all the guys tight I used this set-up on several houses with nary an incedent of any type.

With 2 sets of guys (one at the top and one at the middle) there was no chance for the wind to get any lever action to topple the mess.

The trick (I guess) was ALWAYS making sure ALL the guys were tight!

This survived much rough weather including huricane force winds that up-rooted 2 trees in my front yard.

Jim Starr

Concerning sealing the holes when a roof mounted tripod is removed:

When I roof mounted my beam (Message of August 6 with the creative
spelling of "joist" and "lintel"), I missed the joists with a few holes
and had to seal them up. My approach was to drive a short length of
roofing cement coated wooden dowel (purchased at any hardware store)
into the hole so that the top of the dowel was recessed about 1/4"
below the roof surface. I then filled the space above the dowel with
more roofing cement. I've had no problems whatever with this kind of
patch.

Bruce,

Meeting on the air sounds like a great idea. I have a TS930s operating barefoot with the capability to operate 80 through 10 meters. I would think that 20CW about 0200 UTC would be a good place to start with movement to the phone band if conditions permit. I'm free most evenings at that time.

Let me know.

Keywords: Two-meter antenna MB

Does anyone have some advice regarding a two meter antenna for my MB car. It has a motorized Hershberger antennna which I have thought of trying to use, but is seems a difficult problem. I am considering a "disguised" antenna from Antenna Specialists which uses a splitter to allow use by BC/FM radio.

run
> for its money.
>
> The new R7000 looks just like its hf cousin, the R71A,

I hear that a computer controlled interface for the R71A will be
published in September or October Popular Communications. I hope
that it will also work for the R7000, since the %$#(!!) ICOM
folks left it out and won't even talk about it!
  Also, the specs I saw at HAMCON (Long Beach 8/10) were continuous
coverage from 25-2000 MHZ, with specs guaranteed to 1300 MHz.
  By the way, I saw the Yaesu FRG-9600 running under computer
control at the convention, and it is FAST (20-50 channels/sec)! However,
if someone can kludge the same capability ine of lab equipment.

Our Ford Van in the Fire deparment has the siren and radio controls
bolted to the back of the engine cover between the two seats.

Bob;

I might suggest 15 mtrs instead of 20. Starting out w/CW and then
moving up sounds good, I haven't done any CW for a long time and
would like to get back in practice.

0200 (which is 1900 hrs PDT) is OK except Mon. and Wed. On those
days I have masters swim practice which lasts until about 19:30.

Just as a check on netmail delay, I am sending this at 9:45 am 8/12/85.

Re: phased verticals.

As I have noted previously on the net, I have had excellent results with a single, center-fed vertical on 20-15-10. This one is 32 feet long, which is about as long as I can string up in the trees in my yard. If you are going to use a self-supporting antenna (or at least the top half) you can approach twice the tree height, or around 40 meters of height. This would allow you to use the antenna even on 80 meters as a half-wave vertical. Certainly 40 meters would be within your reach.

I have found center feeding with open wire line (or twinlead) to work quite well. Theoretically and practically, it has the advantage that you don't have any losses due to feeding RF currents directly through lossy ground, as you would with any end-feeding scheme. End feeding a half wave is not as bad as for a quarter wave, as the radiation resistance seen at the end of a half wave is quite high, requiring relatively low current for a given power level, and therefore inducing less power loss in the (fixed) ground resistance than the high currents needed to feed a quarter wave would induce. However, center feeding is even better because the entire transmitter output is fed into useful, radiating antenna wire instead of ground. The only losses you are absolutely stuck with are (1) currents induced in the ground and other objects by radiative coupling and (2) losses in the antenna wire and feedline, connectors, tuners, etc. (2) can be reduced to essentially nothing by spending money and by attention to detail and (1) can be reduced to nearly nothing by getting the antenna up away from ground a bit. Even with it nearly touching ground, however, my experience indicates that (1) is a fairly insignificant loss at least at my location. (It would depend on ground conductivity.)

It appears to me also that the use of a half-wave or longer radiator results in a better pattern especially for low-angle radiation. Look at the plots of half-wave verticals over ideal lossless ground for some clues as to how to pick up big gains on the horizon or near it. Then compare with the similar curves for quarter waves to see how to lose low-angle power. It looks to me as if a half wave has a significant advantage over a quarter wave in producing radiation at low angles.

I have pondered the problem of how to feed an array of such antennas. The best solution I can come up with for multi-band operation is to install a rack full of tuners, one per antenna, and tune them all up for the band of interest so that the tuner inputs look like 50 ohms pure resistive. Then you can switch in 50-ohm coax sections to your heart's content to obtain the desired phasing. If you are rich enough to use automatic antenna tuners, this wouldn't even be especially inconvenient. Of course then you could afford a tower and a stack of monobanders instead!

Once you have tamed the impedance problem by using tuners, you still have the problem of how to set up the phasing. The problem is that the antenna spacing is a different fraction of a wavelength on different bands. Maybe you should let your microcomputer model the array in its little mind and select a phasing scheme which it likes and then switch in the proper lengths of coax with a set of relays under its control. Then you never even need to know how it

did it, as long as you like the pattern it draws for you on its screen.
I suppose while we are dreaming it could also learn how to set up all the tuners for each operating frequency of interest and store all this away for future use. It could either display the settings for you to crank in or else it could tune up the proper settings for you with motors under its control.

If you don't like a rack of tuners, there are cheaper ways to phase things, but they may be difficult to figure out for multiple bands. The Sterba Curtain or Bobtailed Curtain are examples of cheap ways to phase radiators on a single band for a single direction. The W8JK array may also give you some ideas. A single pair of radiators in the 8JK configuration will give you about 4 dB of gain and can be fed with a single tuner. You ought to be able to get about 7 dB of gain from a set of four radiators fed according to the 8JK concept. However, I don't see any easy way of getting this much gain in multiple directions without a fully flexible phasing scheme (which always makes me think of the tuners and the coax switches).

I would be interested to hear what else you come up with or to fill in details which are not obvious to you from the above.

73,
John S., W3IKG

Bruce,

First, I received your message 8:11 AM EDT, so delivery is nearly 20 hours.

Assuming you won't receive this in time for tonight (Tuesday, Aug 13), I suggest we try for Thursday, Aug 15. Lets use 15 meters as you suggest, but the band is often quite dead by 2200 local time (0200 UTC) here in the East. Just in case, lets start at 21.06 Mhz with a QSY to 14.06 at 0215 UTC if we haven't hooked up by then. I'll listen Friday, August 16

as well, but I'll be out of town for the next few days after that, so
the next I'll be available is Thursday, August 22.

I'll keep the CW slow, but hopefully we can make a solid phone contact
which would enable us to convey more information (hi).

73 es hpe to c u Thursday nite.

Interested in communicating about and via amateur radio with hams from all over the world, many of whom don't speak English? The Internacia Ligo de Esperantistaj Radio-Amatoroj is set up to help you do just that, using the international language Esperanto. For more information, contact: W2CIL E. Lindberg, UEA FD Buffalo, New York.

Learning enough Esperanto for simple correspondence and beginning conversation should be a matter of a few weeks of occasional spare-time study. The simplest way to get started with Esperanto is by the free correspondence course offered by the Esperanto Information Center. For the first lesson, send an SASE to: Verda Stelo, 410 Darrell Road, Hillsborough, CA 94010, USA; or reply to me by e-mail for an ascii version.

[An announcement along these lines may have appeared here some months back;
if so, sorry for the repetition.]

Several of these frequencies are in the aircraft band.

121.5 is the civilian aircraft emergency frequency. I thought this was
by international convention. I would be very surprised to find anyone
transmitting routine messages on it. I certainly have never heard any.

In fact, I thought that the whole band between 118 MHz and 135 MHz was
alloted to aircraft operations. Can anyone correct me on this?

I am having problems with signals from my (and my neighbors) televisions getting into my HF radio gear. What I am experiencing is "howling" signals spaced about 15 khz. across the HF spectrum; 20 meters seems to be the worst. I am using a Butternut vertical, and Atlas, Ten Tec and Heath radios.

I would appreciate hearing from anyone who has an idea how I can eliminate this "reverse TVI" problem.

Tnx es 73

Probably the best source of information for the 820 is a magazine called "Micro Cornucopia". There have been many articles about the things you mentioned in back issues.

Micro Cornucopia
P.O. Box 223
Bend, OR 97709
(503) 382-8048

Other than that, we have published a few minor items in our VIP newsletter here in the Vendor Programs Group at Xerox, Lewisville, TX. Nothing of a highly technical nature though.

Not long ago someone posted a review of the new ICOM VHF/UHF receiver. I neglected to save this and would like to see it again -- if someone could send me a copy (rshapiro@bbna.arpa) I'd appreciate it.

Also last night on Radio Netherlands there was a fairly negative review of the Yaesu VHF/UHF radio. Does anyone have info or

opinions about this model?

The Old Bridge Radio Association, Old Bridge New Jersey is
holding a Ham Radio auction at the KofC Hall on Pace Street
in Old Bridge (near route 18 south) beginning at 10 AM on
Sunday, September 8, 1985. Admission $3. Talk-in on Old
Bridge repeater - 147.12+600. This is about 7 miles south
of NJ Turnpike exit 9. Doors open to sellers at 8AM and
to buyers at 9AM.

Keywords: ham-radio 2-meter England

I am about to make a trip to England and would like to operate two meters
with my HT. I have a G0 licence.

Do I recall correctly that the repeaters there require a 1500 Hz tone burst.
I suppose outboard devices are sold there. Is there any easy way to
make one?

    I am working on a project for a solar powered radio site. We need
(for obvious reasons) to be able to measure battery charging currents. The
solar system is charging a 12 Volt battery. A TTL uC (68705R3) will be
used for telemetry, and it has an 8 bit ADC with 0-5V input range. The
question is: How can I measure the charging currents (0-200 Amps) to 5%
accuracy without incurring significant voltage drop, and using the
ADC described above? Does anyone know of current transducers which are
commercially available? (We would rather buy than build unless the solution
is pretty simple - the site is accessible only by helicopter and is not
a great place for experimenting.)

qst de k9eui
hr propagation forecast bulletin nr 33 from arrl headquarters newington, ct august 19, 1985
to all radio amateurs bt

from august 11 through 18 the solar flux was never higher than 68. there were five days of 67, and on the 17th a 9 year low record of 66 was recorded. we have to go back to july 1976, to find the only other 66 of this sunspot cycle, which actually began early in that month. to place this information in proper perspective, it should be pointed out that the first 66 in the down side of cycle 20 came in may 1976, and there were monthly solar flux averages in the low 70s as far back as december 1975.

the continuous solar flux record goes back only to early 1947. it shows that cycles 18, 19, 20 and 21 are all quite different from one another. the record does not necessarily indicate an early end for cycle 21, though something less than an 11 year life does now appear as a likely possibility, to be discussed

in these bulletins later as more evidence is obtained.

though no spots have been seen on the sun since a very small one appeared on august 10 and was gone the next day, a moderate flux rise is expected this week, probably peaking around the 26th. there is normally a gradual improvement in the dx picture in august, as the sun becomes more favorably positioned for the northern hemisphere. dx activity should pick up slightly on 21 and 24 mhz, and some north south dx should show on 28 mhz. even small solar flux variations will show more effect on propagation after early september.

american sunspot numbers for august 8 to 14 were between 0 and 12 with a mean of 6 ar

I'm looking for current brief summaries of schedules for English
and German language broadcasts to North America from Radio Deutsche
Welle (the Voice of [West] Germany) and Radio Austria (don't know
its formal name) in the 2200-0300 UTC timeframe. Can anyone help?
I am particularly interested in on-the-air German language coursework
and also in news of Germany and Austria. Thanks in advance!

I purchased a IC-27H about 8 months ago and installed it into my
cassette slot of my dashboard. The +12V cable is directly attached
to the positive battery post and the ground to the chassis. The
antenna is a motorola 1/4 wave mounted on a through hole mount
in the center of the roof.

Here's the rub: over a period of about one month I have noticed a
drop in the low power level. I drive out of town every day and
when talking to fellow hams noticed that they complained about
noise and flutter on my signal at progressivly closer points to
the repeater we frequent. Upon getting very frustrated with this
I attached a wattmeter and found the high power level was ~40 watts.
Good enough, checking low power showed ~3.5 watts. Again, good enough.
Now this was with the engine turned OFF. When I fired up the engine
(big 1600cc Toyota) the high power reading remained the same but
low power went to 0.1 - 0.2 watts!!!! Thinking a power line noise
problem existed I checked the battery line with my trusty Tek
scope and found noise but nothing over 1/2V. Nothing to worry about
in my book.

Now I'm about out of ideas. Does any one else have this problem
and if so HOW DID YOU FIX IT??? Anyone have any other ideas??
Any help is appreciated!!

I thought this would be easy but....

I am looking for the standard format for Amateur Radio messages handled
in the net systems. I have listened in to several sessions and some
of the messages passed and still have some questions.

1. What is the "proper" format for the messages ?

2. What are the rules for word count within the message ?

3. Where can I get a list of the standard "ARL __" message
   abbreviations ?

About 10 years ago I had this stuff but I don't remember where it came
from. I will be using my 2m HT on a camping trip to send whereabouts to
the wife and would like to be an orderly traffic originator.

Thanks for the responses (in advance)

Hello Dan,

Welcome....

The real hitch in all the great ideas of using Ham Radio for networking
is that Ham Radio must be REALLY noncomercial. You can't use it to
conduct business, talk TO your business, etc., etc. Thus, putting
an amateur link in something like THIS network would be next to impossible.

Sorry, but that is how I understand the rules (and practice) to be.

73,

Bob W3OTC

Perhaps the 121.5 access is receive-only? Or perhaps it does transmit
on 121.5 when it is being used for search-and-rescue work?

As I understand it, the SARSAT program operates by having a satellite
pick up transmissions on 121.5 and rebroadcast them to a ground station
(I don't know if any frequency change is involved) where, from the
known position of the satellite and the Doppler shift of the received
signal, the ground location of the transmitter is calculated.

Anyone have a better understanding of it?

I am new to ham radio also. However, as I study the regulations
for my exam, I notice part 97.117 of the FCC regulations governing
amateur radio:

"The transmission by radio of messages in codes or ciphers in domestic
and international communications to or between amateur stations is
prohibited. All communications regardless of type of emissions employed
shall be in plain language except that generally recongnized
abreviations established by regulation or custom and usage are
permissible as are any other abreviations or signals where the intent is
not to obscure the meaning but only to facilitate communications."

The best magazine I know of for 820 hackers is Micro Cornucopia. They
publish bi-monthly, and have a regular 820 column. Many vendors for
the 820/Big Board market seem to advertise there. They can be reached
at POB 223, Bend OR 97709, (503)382-8048.

Good luck.

Not only must it be noncommercial, but NO ENCRYPTION is allowed.
97.117 states "The transmission by radio of messages in codes or
ciphers in domestic and international communications to or between
amateur stations is prohibited...."

We have been trying to figure out how to allow a kind of remote-login facility here, wrestling with things like security requirements and the FCC rules.

We have come up with some partial solutions in regards to "hooking it up" (over a LAN) to one host only, and warning people that it must only be used for educational purposes. (This seems to be the one purpose that both the FCC and my work place will allow.) The capability is not currently operational.

Some of our solutions deal with one-way BIUs, extra security on the "host", and a one-time numeric password idea that I would rather not put over the net to everyone. If you want, give me a call, and we could discuss what we have been doing here. Are you at Harvard University? That is within a reasonable distance to get together and have an "eyeball".

One should also note that the amateur bulletin boards of the W0RLI vintage DO ALLOW remote "login", however, they are public access systems. They rely on the requirement for stations to ID themselves, not use false callsigns, etc. to figure out who they are talking to.

As far as secrecy of messages goes, I would say "forget it" when you are dealing with amateur radio. The TAPR boards have readily available a "listen and type out everything you hear" mode, and the law does not help at all either (Amateur radio is one of two services that does not have the secrecy of communications protection of the Communications Act of 1934).

73, and good luck,

For Sale: Ham Radio Station and Oscilloscope

Icom IC-720A transceiver with narrow CW filter
Icom PD-15 power supply
Icom IC-SM5 desk microphone
Icom hand-held microphone (not used for mobile operation)
AEA AMT-1 Rtty/Amtor computer interface
Astron RS-7A 12 volt dc power supply
Hustler vertical antenna (80, 40, 20, 15, 10 meters)
Heath IO-4105 oscilloscope (5 MHz, single trace)

The transceiver is in very good condition and has never been used for mobile operation. The oscilloscope is in mint condition because it has received practically no use since construction (it was certified by Heath as in perfect working order). The AMT-1 will work with most microcomputers that have some kind of terminal program for communicating with other computers.

I prefer to sell the whole group as a package for $1500 (I'll pay the shipping), but will consider other offers.

Call me at 312-962-6091 (Mon - Fri, 8:00am - 4:00 pm CST) or 312-947-9544 (Mon - Fri, 5:30 pm - 10:00 pm CST, or all day on weekends).

OOPS... My previous posting on this lost the first line. Apologies to those who had to read it. Let's see if this works better:

I would like to find out how to get Keplerian elements for shuttle missions other than those carrying ham operators. Anyone know how?

ATTENTION !!!!!
   Ham radio operators who want a commercial station...
   Music lovers tired of 'Joy' 'Magic' 'Evergreen' and Madonna
   Kate Bush lovers who think that these towns can support
     such a thing
   People who wanted to know exactly where the heartland of
     America is

I am posting to net.analog the FCC lottery results for the 683 80-90 FM channels opened up beginning in October. NOW IS YOUR CHANCE to own your very own RADIO STATION, and to change the face of broadcasting forever...especially you people in net.music, who could stand to own a few radio stations.

Best of all, they're FM !!!!!!!!

At worst, the towns make for some interesting reading. If you know of any of these places, and their populations are under 1000, please let me know (I'm curious about how many of these are swamps and intersections of highways with a residential population of 39).

There are also details of how the assignments were arrived at, and how you can compute where the transmitter has to go (a few of these really are limited to an area of 1 - 2 sq miles or so, the area being in a genuine, 8 foot deep, swampola!)

Happy Filing !

I think it is noteworthy to look at section 97.69, Digital Communications.

Paragraph (c) subsection 1: "In addition to the above provisions, the use of ANY <emphasis mine> digital code is permitted on amateur frequencies above 50 MHz, except those on which only A1 emission is permitted, subject to the following requirements:

(1) Communications using such digital codes are authorized for domestic operation only (communications between points within areas where radio services are regulated by the U.S Federal Communications Commission), except when special arrangements have been made between the United States and the administration of any other country concerned.

(2) <Deals with bandwidth restrictions. Notably: any BW permitted above 1240 MHz as long as sidebands stay in band.>

(3) A description of the digital code and the modulation technique shall be included in the station log during all periods of use and shall be provided to the Commission on request.

(4) When deemed necessary by an Engineer-in-charge of a Commission field facility to assure compliance with the rules of this part, a station licensee shall:

(i) Cease the transmission of digital codes authorized under this paragraph.

(ii) Restrict the transmission of digital codes authorized under this paragraph to the extent instructed.

(iii) Maintain a record, convertible to the original information (voice, text, image, etc.), of all coded communications transmitted under authority of this paragraph."

I'm not sure I understand the intent of these rules, but it would seem to allow user-to-computer communications using encryption PROVIDED that a record of all such communications was kept. Any opinions?

Regarding Mike's comment that 97.69(c) permits the domestic use of
any digital code, subject to certain restrictions:

I think that the context of the rest of the section, and of the rulemaking
in which that section was created, makes it clear that the use of the
word "code" does NOT allow for encryption. It is used in the
sense of American Standard CODE for Information Interchange (ASCII), or
the Baudot code (or Murray code) or Hollerith code or whatever.

In my comments filed to FCC during that rulemaking, I suggested that
a group of hams might have a pile of Friden FIO-DEC flexowriters
or some other totally obscure devices which use an oddball code. I said
that it seemed to me to be in the public interest to let them use
such devices, as long as there was no intent to be secretive about the
communication and as long as they used a standard means of ID'ing their
stations, such as Morse or ASCII or voice.

It looks like they bought my argument. I think that's what this section,
quoted by K3MC, means.

Bob, I believe you are right about the encryption issue - the purpose of
encryption it to INTENTIONALLY obscure the meaning of the bits. In the
beginning of 97.69, it says "These digital codes may be used for such
communications as (but not limited to) radio teleprinter and other objects,
transference of computer programs or direct computer-to-computer communications
and communications is various types of data networks (including so-called
'packet switching' systems); provided that such digital codes are not intended
to obscure the meaning of, but are only to facilitate, the communications, and
further provided that such operation is carried out with other regulations
set forth in this part."

So, it seems like sending Huffman-coded text files (to reduce time &/or BW
requirements) would be perfectly legal, but sending Huffman-coded text files
for the purpose of encryption would be illegal.

Does this seem like a gray area? -Mike, k3mc

It wasn't too many years ago that the only digital codes allowed for Amateur transmission were International Morse, American Morse, and Baudot. Then the FCC allowed ASCII, and eventually AMTOR and "any digital code above 50.0 MHz."

I interpret those rules to have meant that before the allowance of arbitrary digital codes, it would have been illegal to transmit raw binary object code from your microcomputer over your packet-radio setup. It would have been legal, say, to transmit ASCII-coded representations of the hexadecimal characters that made up your object code. I believe the new rules are intended to permit the efficient transfer of data. After all, it only takes 8 bits of raw binary to send 8 bits of data as opposed to 16 bits of ASCII (i.e. two hex characters represented in ASCII). Also, the new rules permit experimentation with techniques such as Huffmann (Huffman?) codes for data compaction and convolutional codes for error correction.

The FCC has given us permission to experiment with modern techniques with the intent of increasing the usefullness and efficiency of digital communications. We must remember, however, that one of our rules (I don't have the number handy) forbids us from taking steps to hide or obscure the meaning of our transmissions. I know that there may be little chance of ever being charged with a violation of this rule as a result of your use of data encryption, although the probability might be about the same as for those fellows who get caught running 10 kW. The point is, if the FCC asks why it can't make heads or tails of your transmission, you better be able to hand them a paper explaining how your technique furthers the efficiency of Amateur communications. If you don't have a good answer, you may end up reading about yourself in the Happenings column in QST.

I know that this isn't a particularly ham radio item
but I figured that hams would get as much a chuckle
out of it as anyone else.

From page 144 of the 1986 Radio Shack catalog, upper
left hand corner:

> "Radiation Monitor/Alarm...
>
> Like a smoke alarm alerts you to fire, this system
> warns of the occurrence of a nuclear incident early
> enough for taking intelligent, planned and effective
> action to protect yourself and your family.
> Continuously monitors the air for Gamma and X-rays.
> Exposure in excess of 4 milli-Rem/hour, about 1/25th
> of the dose necessary to cause any discernible
> effects, triggers the alarm. Includes graph for
> calculating actual exposure level. LED and audible
> alarm indicated when to replace battery. Reset/mute
> button. Mounts anywhere. Requires 9V cell. $39.95".

Actually, after thinking about it, I'm not sure whether to
laugh or cry.

H E L P !!!

  I recently acquired a CV-89 Terminal Unit for FSK transmissions. I don't have any documentation or specs. Does anyone out there know of this piece of gear. Is it easily convertable to AFSK (I want to use it on 2-meters attached to my Commodore 64). I run a TS-120 HF rig, and don't really know if it will handle FSK vs AFSK (power-wise).
Can anyone out there give me some technical poop on this equipment ??

  Many thanks in advance....

SCIENTISTS SAY 2 METER BAND MAY BLOW UP

Scientists at the international Academy of Amateur Radio in Blue Bank, Sunderland, held a news conference today to reveal the results of a study which shows that the amateur radio two-meter band is on the verge of a violent explosion. The impending catastrophe was announced by Dr. Flaubert L'Spigot, Acad president. "Eet eez a beeg dangair zat zee two meetair band weel blowing up in zee face of zose who using eet," said Dr. L'Spigot. The good doctor's remarks were interpreted for the press by the Academy's press secratary, Ms. Pamela Sue Teton. "What Dr. L'Spigot said was that the two meter band might blow up soon," said Ms. Teton. When asked what Dr. L'Spigot meant by his statement, Ms. Teton explained that she did not have the faintest idea. At this point, all reporters know is that there is a possibility that the two meter band may blow up soon, but only those who understand some sort of foreign language know when or why. For more information be sure to stay tuned to this newsletter.

RICHARD NIXON SEEKS WHITE HOUSE POST

At a clandestine hideout meeting last Wednesday, an unnamed sorce told GEARVAKf Bulletin reporters that former President Richard M. Nixon is looking for a White House post to make his retirement years more meaningful. The post he would like to have, says the unnamed sorce, is one of those that holds up the roof on the North Portico at the White House. President Nixon wants the post to use in the redecoration of his New York condominium apartment.

CONSTRUCTION ARTICLE
-ADDING A "MAGIC EYE" TUNING TUBE TO THE TS-930

As most owners know, the Kenwood TS-930 is a fine rig with the exception that the built in S-meter is poor in appearance and awckward to use. With little difficulty, however, the S-Meter can be replaced by a sophisticated, green "magic eye" tuning tube as used in Gonset Communicators in years past. The electrical changes are simple. The existing S-Meter can be removed with a pry-bar or wood chisel. The front panel opening is then enlarged with a rat-tail file, and the "magic eye" tube is fixed in place with white "medical" adhesive tape. Use tinsnips to cut an empty Sucrets can to form a new bezel. Paint it grey for a professional appearance. The filimant transformer for the 6E5 tuning tube can be obtained from any junk TV set and mounted on the top cover of the transciever, 2 1/4 inches in from the right rear corner.

-N4GG-

FCC LAUNCHES CALLSIGN STUDY

Mr. Knurled F. Lywheel, spokesperson for the computer operations at the FCC, yesterday announced the start of a three-month study into new callsign allocations for the Amateur Radio Service. "Following the trend of the past few years," he said, "we will be changin?rall callsigns into a format that makes it easier for the FCC computer." (A Univac model 1-A) The study will determine if binary, hexadecimal or machin? language callsigns will be easiest. A typical Callsign like W1ABC will be changed to 1011000010110, 6A33EBO, or !&#??X-@ depending on the system finally selected.

-N4GG-

TWO METER BAND EXPLOSION IMMINENT

According to observations made at the GEARVAKf Scientific Studies Committee's Mt. St. Lishnus Observatory at Mt. Idy, Ohio, the two meter amateur band is in grave danger of violent destruction due to radio frequency overpressure. Said Studies Committee Charip'son, Dr. Arvuell U. Harnishe, Co-disoverer of the Harnish-Lishnus Effect, "It seems to me that the 2 meter band is on the verge of going ka-boom!" Dr. Harnishe explained that the build-up of radio frequency over-pressure has been going on for a long time, particularly since the marketing of supersenitive two meter recievers incorporated in the thousands of 2 meter transcievers sold. "What apparently is happening," said Dr. Harnishe, "is that the new recievers are not taking very much RF energy out of the 2 meter band because they don't require much signal to produce good readability at the speaker. "That being the case," he went on, "an excess amount of RF has been building up on the two meter band for many years due to the new, more sensitive recievers. Although the RF levels have been building up, Dr. Harnishe believes that there was plenty of rroom on the band to accomidate the excess RF due to a certain degree of elastmgity in the band. Elso, he pointed out that there has been a certain amount of leakage on the band which has acted as a saftey valve, until now. "What triggered the crisis ," Harnishe said, "were two events: first was the launch of OSCAR 10, which poured a great deal of downlink energy onto two meters for up to six hours per day without let up. The second was the W5LFL operation from the spacecraft Columbia. During the Space shuttle mission, so much RF was pumped into the two meter band by hams wanting to QSO with Owen that the band was stretch beyond it's elastic limit." According to Dr. Harnishe's Scientific Studies Committee Study Team, the two meter band began to show strech marks on the shuttles 79th pass. By the time the mission ended, the danger of expolsion was only averted by the cooling effect of frigid weather which overtook the country at the time. Even though two meter activity has returned to normal, the danger still exists because the newest crop of recievers are still more sensitive and require almost no RF in order to make a signal audible. That could cause a greater buildup of RF pressure on the band until it expoldes. Said Dr. Harnishe, "An explosion of the

band will cause widespread damage to all adjacent VHF frequencies and might irreparably damage two meters for all time. The only remedy for this crisis," he said, "is either to short circuit two meters to ground-- something we haven't figured out how to do, yet--or get everybody to o listen on two meters, preferably with very old recievers, and not transmit for at least six months." Noting that in some areas of the country this practice has been given a successful try, Dr. Harnishe is advocating that repeater groups in all big cities, particularly in and around Los Angeles, give the no-transmit idea a try.

>computer network?

Yes they can. And they are, but under the normal restrictions of the Amateur
Radio regulations, which might put a bit of a damper on your enthusiasm.

Amateur Radio may not be used to conduct the normal business activities
of any business -- profit or non-profit. And Amateur Radio transmissions
must be in plain text, not encrypted, though any standard communications

code may be used. (I'm sure if I'm not current on my regulations I'll be told.)

That pretty much leaves out most of the USENET newsgroups, and a great deal of the UUCP mail traffic. Though USENET is probably closer to qualifying for distribution by Amateur Radio than anything else I've encountered.

I have had the same problem with reverse TVI. In my case, the problem set is my own RCA XL-100. While it has a power transformer, the chassis is not isolated from ground. The primary has an autotransformer connection (about 200V I think) that is used for powering the deflection circuits so one side of the line cord connects to the chassis. Besides this, the case is non metallic and offers no shielding at all.

A good deal of the radiated horizontal deflection signal is via the AC line and a good grounded line filter will help. You did not state if the TV sets were using twin lead or coaxial antenna systems or connected to a cable system. Mine is fed with 300 ohm line and a TVI preventing type hi-pass filter in the lead-in helps reduce the radiation from the set also. I would think that 20 meter traps in the sets antenna system might help too.

> "The transmission by radio of messages in codes or ciphers in domestic
> and international communications to or between amateur stations is
> prohibited. All communications regardless of type of emissions employed
> shall be in plain language except that generally recongnized
> abreviations established by regulation or custom and usage are
> permissible as are any other abreviations or signals where the intent is
> not to obscure the meaning but only to facilitate communications."

There has been considerable discussion on the topic of authentication vs
encryption in the amateur service. So far, the consensus is that the FCC
doesn't prohibit the use of codes as long as they are for the purpose of
authenticating the sender and not for the purposes of hiding what he's
saying. A precedent: touch tone codes for repeater control and so forth.
(There is a special exception that allows encryption on amateur satellite
control links, but that doesn't apply here.)

Paul Newland, AD7I, presented a paper suggesting several possible schemes
in this year's ARRL Computer Networking Conference. The basic idea is to
calculate some function over a packet, encrypt it and send it along with
the packet (which would be in plain text). Any modification or forgery
of the packet would likely cause the encrypted check number not to match.
You might think of this as a "checksum" or "CRC" function whose intent
is to protect against intentional corruption by an intelligent human
instead of random corruption by natural processes like noise.

The ham bands have a number of very significant limitations as
far as computer networking is concerned:

1) No traffic that is even a little bit commercial can be transmitted.
   Much Usenet traffic falls into the "somewhat commercial" area,

including queries from people working for some company for some software or product, other people announcing software and products, etc. Job announcements, etc. also fall into this area. In general, there is a lot of content on Usenet that would be considered commercial under FCC rules.

2) Rules for content (no libelous, copyrighted, obscene, etc.) material are very strict.

3) No unscreened third-party traffic may be transmitted on the ham bands. Virtually all netnews materials, other than particular articles written by the person owning the radio him/herself, would fall into this category! A ham would have to sit there and screen every article before initial transmission into the ham bands, and would also in practice be taking responsiblity for the "legality" of those messages under points (1) and (2) above. A pretty risky situation.

4) Encryption for the purpose of obscuring message contents is absolutely forbidden on the ham bands.

As you can see, the rules governing the ham bands are fairly strict and introduce a number of VERY significant limitations.

I tried to mail a response, but the path didn't make it...

What you have is ITV - the 15.75 kHz horizontal oscillator is radiating and
giving you the problem. It isn't too easy to live with. Some ideas:

1. If you disconnect the antenna, does it go away? If so, its coming via
    radiation. Add a high-pass filter to the TV, and a ferrite rod or
    toriod on the power cord. If the set has a metal chassis [dream on],
    then ground it but carefully as AC cord reversal could be a shock
    hazard.

2. If its coming via the power line, the above is useful as well as a line
    filter on the rig [computer surge suppressors often work well]. A
    good ground especially on a vertical is always helpful. Mounting the
    vertical on the roof so its above the "view" of the TVs should help.

Finally, you may have to live with it. In a dense urban area you will have
all sorts of crud you can't eliminate and all sorts of nasty things you do
to your neighbours as the result of being *VERY* close. An expense ricebox
with good blanking and using hardline or 100% coverage coax to a balun on
on a dipole or a reasonable radial system on a vertical are helpful, but
ultimately you gotta live with it. I know from ten years of living in
a row house with the antenna (beam) on the roof, 75 m from a 110 KV power
line in downtown Toronto - oh I forgot the hill too! But, DXCC and good
hamming is a matter of making do and forgetting about those W5s with the
200' towers in the quiet country! It also means you sometimes have to
call twice to crack the pile HI HI!

Sir--I would be VERY interested in seeing the FM station list, but
I am not enough of a hacker to know how to read it on net.analog.
Lord knows I've tried, but I have no idea how to get to the article
selection level in net.analog where I can find the header of your

message and thence read it.

So, could you either post it here on net.ham-radio, send me a copy
(PRICE@NOSC.ARPA), or tell me EXACTLY how to get to it via readnews,
please?

Sorry to sound like such a novice, but on computers, I am! Thanx--

Jim Price, K6ZH, San Diego, CA
(619) 225-2665

P.S. Please don't tell me to read the "readnews" documentation as
I did and I still have no idea how to read news!

I'm looking for reviews and opinions of the Sony ICF-2002 and ICF-2010
(the WRTH reviews I've already read). Reports of personal experience
with these would be nice...Also does anyone know the story on the
availability of the 2010? I can't find any locally in the Boston area.
EEB doesn't have them at the moment either.

Comparisons of these radios with the Uniden CR2021 especially welcome.

Many thanks,

R. Shapiro

p.s. The 2002 is known outside N. America as the 7600D. The 2010 is,
I believe, known as the 2001D outside N. America.

Regarding the aircraft-band freq's listed for Salyut 7:

121.75 MHz is used (at least in North America) exclusively for
ground control (tower to aircraft on ground). Nevertheless, the
Russian cosmonauts do use it for spacecraft-to-ground: I have heard
them on this freq.

As for 121.5 MHz, I too would be very surprised to find the
Russians using it for anything other than emergency communications.

We are fortunate that the encryption prohibition is worded the way that
it is, with the key point being whether there is intent to obscure the
meaning of a message. This allows us complete freedom to experiment with any
sophisticated, nonstandard encoding method we choose without worrying
about difficult it might be to monitor. As long as it serves some valid
communication purpose other than hiding the message, we're OK.

A case in point is the 9600 baud FSK modem design by Steve Goode, K9NG.

Steve's biggest problem was to get rid of the DC components in a data stream;
this simplifies the design greatly, since you can use AC coupling and not
worry about things like op-amp offsets, crystal tolerances, etc. One
approach is Manchester encoding, but this effectively doubles the bandwidth
required for the signal. Steve's solution was to add a pseudo-random stream
to the data at the transmitter, removing it at the receiver. In the
commercial world, this technique is commonly known as "bit scrambling", a
term with unfortunate connotations. (The technique DOES resemble an
encryption system, although one based on a linear feedback shift register
would be very easy to break.) However, since Steve's intent is not to obscure
the meaning of a message but rather to simplify the hardware design, it is
acceptable. (Of course, it also helps that he published the algorithm and
encoding/decoding circuit at the last ARRL packet radio conference.)

Phil

Filename Type Bytes CRC

SIMTEL20 directory MICRO:<CPM.HAMRADIO>
FCC.LOTTERY.1 ASCII 16515 7458H

David Anthony <decvax!mcnc!unccvax!dsi@Ucb-Vax.ARPA> recently posted

this list of the FCC lottery results for the 683 80-90mHz FM channels
opened up beginning in October.

There are also details of how the assignments were arrived at, and how
you can compute where the transmitter has to go (a few of these really
are limited to an area of 1 - 2 sq miles or so, the area being in a
genuine, 8 foot deep, swamp).

In article <301@cmu-cs-g.ARPA>, monta@cmu-cs-g.ARPA (Peter Monta) writes:
> Are there ICs which convert +5V to +15V and -15V, at about 40mA each?
> This would be very convenient for providing RS-232 signal levels;
> often this is the only place such voltages are needed. (1488s require
> about 40mA at each voltage.)   ------

You might be interested in a new part from Motorola, it's the
MC145406. It's a CMOS tranceiver that combines the functions of the
1488 and 1489. It contains 3 drivers and 3 receivers. It runs on +-5
V. And it uses 1/10 the power of the 1488. Price is $1.59 in 100-unit
quantities (see _Electronic Design_, August 8,1985, pg. 149).

I spent a couple of frustrating days trying to get through to TAPR last
Monday to place my phone order for a TNC-2. It seems that the phone company
found out what was going on and decided to intervene by telling some great
proportion of the callers that "All circuits are busy. Please place your
call later." A friend of mine figured out how to test this and sure enuf!
the circuits were NOT busy. At any rate, after twelve hours of frustration,
I gave up. Does anybody know how to get one by mail????

While studing for my Tech test, I found a strange question in the question
pool. The question is, What is the 12 meter band? The answer was, 24.79
to 24.99. Is this a Ham band? What class? All the other question in that
section refered to Ham bands, but no chart of Ham frequencies ever listed
that band, including the chart in the same book I got the question from!
(ARRL general study guide 1985-86) Can anyone shed some light on this?

While tuning up on 40 meters last night, my electronic phone started making funny noises. When I tried to use the phone, it was dead. I "fixed" the phone by discharging all the capacitors (big tantalums) and plugging the phone back into the phone line. The phone worked fine. The phone is phone line powered and I think that the bridge on the input to extract the battery was rectifying RF and did strange things to bias circuits in an inoperable way. I seem to have solved the problem with a .005 uf cap across the tip and ring.

My US Robotics Password Modem, however, also appears to have died; apparently from the same cause.

Has anyone experienced similar problems from "RFI"?

David,
This FCC lottery business is very interesting but it leaves me with several questions. I hope you will be able to supply the answers or tell me where to look.

1. Is there any way of knowing the class of each assignment?

2. What units are the spacings expressed in?

3. Is there any way of knowing when the FCC will accept an application for a particular channel? In other words, can I apply now for an assignment from group #16 or do I have to wait until #15 is closed?

Regards,
Lou Kohnen, K2ANC

If you have a reasonably accurate sense of pitch, you can whistle into your
radio at the start of each transmission and key the repeater that way.
This is inconvenient, but then again so is modifying your radio before a trip!

Have a good trip!

One reason the Amateur Radio Service has always been treated so well
by the FCC is that we have a tradition of self-policing of adherence to the
rules and regulations. Tricks to "hide" encrypted material in plaintext would
run counter to this tradition and therefore would be very strongly frowned
upon by most hams.

Also, if such a trick SHOULD be noticed by the authorities, the culprits
might find themselves in a lot of hot water not just with the FCC but with
the FBI until the Feds satisfied themselves that it was in fact just some
computer hobbyists and not something more sinister.

As for cryptographic authentication schemes for computer login, I suspect
that the FCC could be brought around to approving this as in the public
interest as a better way of controlling access to radio-based systems.

The key fact here is that encryption is not used to obscure meaning but to control unauthorized access, and nothing in the rules seems to prohibit this.

I am looking at this type of antenna to use as a base/repeater gain vertical and would like to communicate with some one who has experience and/or knowledge about building these babies.

My sole source is an old ARRL FM and Repeaters Manual and the diagram describing it is for a single halfwave array. I would like to add more sections to increase the gain but do not understand how this is accomplished. The diagrammed array from the bottom to the top consists of: a 1/4 wave stub (for reducing feedline radiation), a 1/4 wave section, a 1/2 section, another 1/4 wave, and finally a 1/4 whip at the top. What I want to do is to add more sections for a higher gain figure but do not know which sections to duplicate. Do I add just more 1/2 wave sections or do I need to add 1/4 wave sections along with the 1/2 wave sections?

Any and all help appreciated. TNX

qst de k9eui
hr arrl bulletin nr 74 from arrl headquarters
newington ct august 26, 1985
to all radio amateurs bt

the arrl executive committee met august 24, 1985, to examine
nominating petitions filed by members in seven divisions for arrl
director and vice director for two year terms of office beginning
january 1.

the following candidates are unopposed and so were declared elected
without balloting.

atlantic director hugh turnbull, w3abc
dakota director tod olson, k0to
delta director clyde hurlbert, w5ch
great lakes director george s. wilson, w4oyi
pacific director rodney j. stafford, kb6zv.

dakota vice director howard mark, w0ozc
southeastern vice director evelyn gauzens, w4wyr.

ballots were ordered mailed to full members in six divisions, as
follows.

atlantic division
   for vice director
      bardsley, kb3om
      mozley, w2bch

delta division
   for vice director

      oubre, k5dvg
      schmidt, w5ghp

great lakes division
   for vice director
      elliott, ka4jmz
      severson, ab8p

midwest division
   for director
      grauer, w0fir
      mccaffrey, k0cy

   for vice director
      eilers, w0yzv
      ridenour, kb0zl

pacific division
   for vice director
      delauney, w6pht
      hill, w6rff
      edwards, w6szn
      koropp, w6yfw

southeastern division
   for director
      butler, w4rh
      henson, wb4znh
in separate elections held in canada, thomas b. j.natkins, ve3cdm,
was reelected without opposition as president, crrl, and harry
maclean, ve3gro, was reelected without opposition as vice president,
crrl. they will serve, therefore, as director and vice director,
respectively, of the canadian division, arrl.

ballots must be received by noon november 20, and will be counted on
the following day.

election results will be announced by subsequent bulletin ar

qst de k9eui
hr propagation forecast bulletin nr 34a from arrl headquarters
newington, ct august 26, 1985
to all radio amateurs bt

beginning august 11 the solar flux was at 69 or lower every day through the 21st, and no higher than 71 through the 25th. this is the most pronounced flux low since the beginning of cycle 21 more than 9 years ago. perhaps even more important, the august flux curve is no better than just even with the july curve at any time. from july 7 through 11 the flux was between 95 and 101. one solar rotation later it was 77 or 76 in the corresponding 5 days, and this was during the best days of

august. through all of the months to date, the flux has never more than just equaled the figure for the july rotation, and it has been as much as 25 points below it.

the propagation effects of the lower flux have been obvious. except for occasional sporadic e skip, there has been practically no dx on 28 mhz, and very little on 24 or 21 mhz. even reception of the usually reliable 10 mhz wwv has been poor or nonexistent in the early morning hours in connecticut.

no sunspots have been seen by the writer since august 10 despite good viewing conditions nearly every day. it is now more than a month since anything more than a single small spot has been seen, and that was back in july. the long calm may end in early september, if not before. geomagnetic activity is likely to be higher around august 27 but generally good propagation is expected at the months end and in the first few days of september.

american sunspot numbers for august 15 to 21 were between 0 and 5 with a mean of 1.7 ar

Arpa/Milnet readers may subscribe to the packet radio mailing list by sending a note to PACKET-RADIO-REQUEST@MIT-EDDIE.ARPA.

A multi-part packet radio tutoral has recently begun and the first
four parts are now available via anonymous FTP (password GUEST) from
SIMTEL20 as:

```
Filename          Type  Bytes    CRC

Directory MICRO:<CPM.PACKET>
TEXNET.001.1           ASCII      6768  EF6CH
TEXNET.002.1           ASCII      7009  A772H
TEXNET.003.1           ASCII     10248  D82CH
TEXNET.004.1           ASCII      6455  C445H
```

Usenet readers can read these by using "readnews", "vnews", or "rn"
(whatever their favorite net news reader is) and telling it they want
to subscribe to net.ham-radio-packet

The circuits most definitely *were* busy--telco didn't step in until
the fireworks were already all over. Note that circuit busy conditions
can exist at both the originating and terminating ends of the circuits,
which seemed to be the case in many instances on TAPR day. About
10K call attempts/hour were being logged to the TAPR number. Note,
however, that a couple of hundred people with daemon dialers can easily
achieve this call count.

Has anyone received the results from CQ WORLD WIDE phone contest
in 1984 yet? I would be interested to know the result from my
operation in Malta as 9H3DN. I don't have the CQ magazine, so I
think the info will arrive late here.

At least two references to traffic handling come to mind. One is
any copy of the ARRL Handbook. The ARRL Operating Guide also gives
a good explanation (1 chapter) on traffic handling. If you write
the ARRL, or give them a call (1-203-666-1541) they will tell you
how to get a bunch of free (except for an sase) info on traffic
handling, i believe its the net directory package. It takes roughly
5 oz of postage plus a large sase (9x12 envelope). I have most of
the above info if you only need a few references.

Re: Watching TV

  I don't know if anyone noticed, but a few weeks ago the Supreme Court threw away a right that Americans have had since day one.
  It has always been the case that everyone had the right to receive any signal being transmitted on any frequency using any kind of receiver. You didn't always have the right to do whatever you wanted with these signals, such as tell anyone about them, but you could always listen to them (or watch them) alone in the privacy of your home.
  But now the court has ruled that people are breaking the law if they watch sattelite TV that is intended to be charged for, even if it not scrambled.
  Comments?
                                        ...Keith
-----end of forwarded message-----
I was struck with horror and disbelief after reading this message. The implications of this ruling set the way for making it a crime to monitor radio signals unless the sender gives express permission to do so. I suppose this could lead to making it a crime to even own certain receiving equipment! I've seen this in other countries but NEVER thought it would happin here in FREE AMERICA!

Ron--

While I'm not exactly an "iron man" of traffic, I have done a fair amount of traffic handling in my days. Format-wise, the ARRL message blanks, available at most ham stores and from the ARRL, are almost self-explanatory. The message # is a serial number from your station, the precedence is routine or higher, handling instructions (HX something) are listed in the back of ARRL log books, the check is the number of words in the text, and so on.

The only thing funny about the word count is that numbers are spelled out unless they are a group like a frequency on 20 meters. Thus, a text line might be "have not heard from you in twenty one days Xray Meet me on 14.250 at usual time" or some such. The check of the words in quotes is 17. Xray and query are used instead of period and question mark.

Also there are the ARL numbered messages which again are listed at the back of the ARRL logbooks. Their purpose is to save time by using canned text for things like county fairs, happy birthday, etc.

If you'd like an on-the-air sample, meet me on 3928 kHz, the Mission Trail Net, at 8 p.m. Pacific Time--be glad to talk to you.

Also, I'm sure the ARRL puts out a small publication that explains all this more precisely, probably for the cost of an SASE.

Happy traffic handling--73

As a sidenote to this discussion, I recall running across a copy of a House bill in the government-documents-repository section of my university library (this was back in the early 60s) which was a resolution or proposed legislation that explicitly stated that "No regulation or law shall be interpreted to in any way restrict the right of any individual to receive any or all signals transmitted via the electromagnetic spectrum" (or words to that effect). However, sadly, I believe that this, one of the few worthwhile pieces of legislation I have ever read, was never passed. Too bad. If it had been, this nonsense would have never arisen.

Will

Maybe it's time to start pressing for an amendment to the U.S. Constitution on this point. "No law, ordinance, regulation, or executive order shall be valid or binding if it abridges the right of a citizen to receive and gain information from radio signals from any source whatever."

The manufacturers of scrambling and encryption equipment should be more than glad to put their attorneys to work polishing up the amendment into a suitable form of legalese. Likewise the manufacturers of consumer satellite dish antennas and VCRs.

There are a lot of tricky issues within Government on this subject, but right now the mood is to get everybody to "button up" their communications. Therefore, stating this principle right in the Constitution would be a good way to relieve everybody of any other protection and force them to focus on encryption.

The key question is whether or not the public would care enough to vote for it in a referendum.

Ref mine of 26 August and the several responses:

My friend simply dialed a phone number one higher than the TAPR
number. When it rang immediately, he concluded, as do I, that the
"All circuits are busy..." message was a sham to discourage us all
from calling and REALLY blocking up all the circuits.
It sure had an effect on me (and others). But I wish I had gotten
through.
                        73,

>
> They were probably wondering if you wanted voice quality or data quality.
> Data quality lines are less noisy than voice quality. It sounds like you
> want a data-quality leased line.

There are several basic categories of leased lines:

(1) SIGNAL GRADE lines provide metallic continuity and will generally provide a frequency response up to 30 Hz. There is absolutely no attempt at loading or other circuit design for voice frequencies. Nothing prevents voice frequency use if the loop is short and within the same central office.

(2) TELEGRAPH GRADE lines provide neutral or polar signalling for tty's, and are available up to 150 baud. Voice transmission is not possible because all you get are signalling leads from a telco interface.

(3) VOICE GRADE lines give you a bandwidth of 300 to 3,000 Hz with DC continuity if within the same central office. E&M signalling is available if more than one central office is involved, but you won't get actual DC continuity any more.

(4) OFF-PREMISES EXTENSION lines giving you voice frequency range with DC and ringing transmission *specifically* intended for use with PBX's.

(5) RINGDOWN TIE LINES like taxicabs, hotels, etc. use. You pick up a non-dial telephone at one end and a similar telephone rings at the other end.

(6) DATA GRADE lines still give you only 300 to 3,000 Hz frequency response with *no* DC signalling; however, the lines are carefully designed for flat frequency response (i.e., equalized), low noise, low envelope delay, low phase jitter, etc. There are various categories of the above parameters called 'conditioning', with typical grades of C1, C2, and C3 conditioning. The higher numbers give better quality for more $$$. Conditioning becomes critical when data circuits must run through carrier equipment.

(7) WIDEBAND DATA lines available in typical bandwidths of 48 kHz and 256 kHz. These lines are so expensive it's unreal.

(8) RADIO PROGRAM lines typically provide *one-way* service for radio stations, and are available equalized for 5 Khz and 15 kHz bandwidth.

(9) VIDEO CIRCUITS where available are gen-u-wine coaxial cable or telco microwave link with a 6 MHz bandwidth. These lines are *so* expensive you don't even want to ask...

(10) DIGITAL DATA SERVICE is pretty much an AT&T offering where you can get data circuits with data sets for speeds from 2,400 baud to 1.5 Mbits/sec.

There are all sorts of variations of the above, like multi-point lines, special burglar alarm lines (series circuits), telex/twx lines, etc.

And then if you want a *real* laugh, ask your telephone company for Picturephone (tm) service... :-) to AT&T

Bob, What is the exact application for your ~leased line~?

re: "...I believe consist of nothing more than a pair of wires
      from one site, to the phone company central office, then to
      the other site with no switching or electronic intervention
      in between...."

The key here is: "no switching or electronic intervention in between"

You can't usually get a metallic pair outside of the serving area of
the first Telco Central office. So, if you need DC continuity past
this boundary, you may as well forget it.

If on the other hand you will be sending tones in the range of ~300 to
3000hz, then you could order 3002 facilities, which are voice grade
lines suitable for data transmission. Cost is based upon tariff
mileage which may be longer or shorter than "as the crow flies"
mileage. There are also "local loop" and "termination" charges
involved, plus a one time installation fee.

There are also 1000 series facilities that are "...unconditioned
channels capable of transmitting direct current mark-space or binary
signals at rates up to 150 bauds. These channels are not suitable for
the transmission of alternating current tones; they are furnished for
half-duplex or duplex operation on a two-point or multi-point basis."
[FCC Tariff 260, ISM TTGD-2] These may or may not have DC continuity
outside of the first telco office.

There are many variables involved - Call me if you want to talk about
it.

The Butternut miniature beam sounds similar to the one Austin sells.
Does it require a tuner with balun? Austin's mini-beam does, and would
have the same property of "using the entire antenna".

This is not a bad way to go, especially if you have a rig with "no tune-up"
output, i.e. your choice of 50 ohms. A tuner is advisable for such rigs
anyway if you want to cover the whole band with full power.

The following is from Amateur Satellite Report #106

          Shuttle 51F Operating Opportunities Announced

NASA, AMSAT and ARRL have announced tentative operating
opportunities for the mission of Tony England, W0ORE, and
John-David Bartoe, W4NYZ.  As previously detailed, actual voice
operating time for the astronauts will be quite limited due to
the heavy "official" workload.  This is reflected in the schedule
below with the majority of transmissions being SSTV scan
converted images from the NASA on-board video.  This will be the
first occasion on which SSTV has originated on a shuttle.
```

The majority of voice transmissions will be with previously scheduled clubs and youth groups. This arrangement is in accord with the express wishes of Tony England so as to make the most efficient use of the limited operating time available.

The downlink frequency will be 145.55 MHz. If an open operating period is declared, you may attempt to QSO with the shuttle on 144.91, 144.97, 145.03 or 145.63 MHz. Listen to WA3NAN on the frequencies listed in ASR 105 for late breaking news on the operation.

The following data is courtesy of NASA spokesperson Chuck Biggs, KC5RG.

Greetings. I'm looking for algorithms and/or code for software
UARTs for speeds up to, oh, 150 bps or so. What I'm REALLY
trying to find is code (8080/Z80 ASM would be best, though
I guess I can take it in any form, including BASIC) to handle
the decoding functions of CW and RTTY listening. While I *am*

interested in systems that depend on UARTs, and would like to
hear about these, I am also very interested in systems that handle
RTTY or CW decoding through watching a single bit (thusly my interest
in software UARTS). Ideally, such systems would require only being
told the word length (for RTTY) and could then determine the proper
speed on its own, and could also handle varying CW speeds.

Any and all information would be appreciated on these topics.
Please reply directly if possible--I'll summarize for this group
later. Thanks much.

--Lauren--
{ihnp4, decvax, seismo, clyde, bonnie, trwrb, ...}!vortex!lauren

P.S. I'm also looking for recommendations for equipment/circuits
for small, low power, flexible, rtty modems. Ideally they should
be able to handle shifts as small as 85 Hz and be able to filter
out the multiplexed rtty channels down to one channel at a time.

I dont know if the Butternut needs a tuner or not, I need to drop
them a line and get the details. Their verticals need no tuners.
How would I go about getting more info on this Austin mini-beam
you mentioned? I've never heard of it until now.

The Conquest SPX-210 looks interesting and is an approach that might be kludged for other scanners.

I have read a description of the JIL SX-400 as "computer controllable", and indeed they sell an interface for an NEC PC. I called them up and asked for interface specs for the scanner itself so that I could control it with a different PC. The response was: "Do you work for the government? If not, we can't give you the specifications. We have no maintenance manual - the product is proprietary".

Sigh...

The Austin mini-beam is a product of

Austin Custom Antennas
P.O. Box 357
Sandown, NH 03873.

The owner, Dick Austin, K1QIZ, can be reached via mail there or at (603) 887-2926.

Actually, he makes two beams, to my knowledge, one of which is VERY small, like maybe 10 by 15 feet (a guess) and 5 or 6 pounds. This is the one that has about 4.5 or 5 dB gain over a dipole. It covers 20 through 10 (including any new bands that happen to pop up in there) and is available in a "portable" version that can be knocked down into about 5-foot lengths and carried in a canvas bag. Could be real neat for field day! Either version can be mounted on standard TV masting and rotated with a standard TV rotator without strain. It probably has less weight and wind loading than a lot of big TV antennas!

The other one covers 40 through 10, with somewhat more gain except on 40, as I recall. This one is a lot bigger, like 30 by 35 feet or so (again a guess). It is also heavier, but for a 40-meter beam it is tiny and light by comparison to other ones available. It is probably lighter and smaller than some tribanders. This one I believe is WARC-band ready and covers all of them, both present and future, if they are between 7 and 30 MHz. The price you pay for this is that you supply the funny tuning reactance needed down there in your tuner instead of having him precompute it and install it for you up in the beam. And you should use open-wire line or TV twinlead (best foam type available to you) instead of coax except possibly for a short run from the tuner to the balun.

Incidentally, Austin also sells a variety of other antennas, including various collinear verticals for 146, 220, and 430 MHz bands, two of which cover ALL THREE BANDS in one whip, a scanner antenna designed to cover most scanner frequencies of interest and to give decent performance over the whole band, and a telescoping half-wave for your 2-meter HT. His latest thing is a nifty new antenna for 900 MHz cellular telephone service which reportedly runs rings around some of the antennas being sold for that purpose. His VHF and UHF antennas are with few exceptions independent of ground and none of them use radials. They are, however, well decoupled from the feed line so that the pattern is nearly ideal without radials and without adjustment.

Also, he really MEANS the "custom" in his company name -- he will make up specials for repeaters, mobile homes, or your hang-glider. He will talk antenna theory with you at length, even if it helps you to avoid buying one of his products by building your own!

73,
John S., W3IKG

A friend has asked me to try to obtain a list of the "10-codes" that
the police use in radio communications. I once had such a list but
can't find it at present.

Could someone on the net supply the complete list, or a source in which
I could find it?

Also, a few references to publications that give information on local users
of VHF/UHF radio frequencies, codes like the 10-codes, special jargon, etc.,
would be appreciated. All of this is for an elderly gentleman whose main
interest is his scanner but who lacks information with which to appreciate
all that he hears. A few key publications would probably get him off to a
good start.

Thanks for any assistance that is forthcoming.

Help! My aging Tektronix oscilloscope, type 315D, is in need of repairs,
and I cannot locate either a manual or schematic for it. I was told at one
time that only microfilm copies of these remain.

If you can help me locate these, please let me know. I will gladly pay more
any duplication costs, or costs of obtaining the microfilm records.

A N N O U N C E M E N T !

TAPR TNC 2 NOW AVAILABLE!

Tucson Amateur Packet Radio is pleased to announce the availability
of the new TAPR TNC 2.   In field testing since January, it is now
ready for you!

Effective Monday, August 19th, the TAPR Office will be accepting

orders and, for the first week, will have extended hours (9 AM until 9 PM Pacific Daylight Time - 12 NOON until 12 MIDNITE for you Easterners). (These extended hours are possible through the participation of volunteers, some of whom are travelling to Tucson from all over the country to assist you in obtaining a TNC 2.)

280 TNC 2 kits will be ready for shipment on or about August 19th. All parts are in hand (and boxed!) EXCEPT

a) the manual, which is at the printers and is expected back on the 16th, and

b) the cabinet end plates, which will ship to TAPR on or before the 10th of September. The first units will be shipped WITHOUT the cabinet end plates; the end plates will be sent to TNC 2 owners as soon as TAPR receives them.

The price for TNC 2 is $185 plus $10 S & H. A credit card order incurs a 3% surcharge (that's what the bank charges us) for a total of $200.85. Arizona residents must add tax, of course.

To order your TNC 2 kit, follow these simple rules:

1) Call the TAPR Office at (602) 746-1166

2) Have the following information available

   * Your Name

   * Your UPS shipping address (no PO Boxes, please)

   * A DAYTIME telephone number at which you can be reached

   * Your VISA or MasterCard number and expiration date

3) Two shipping labels (one for the TNC 2, one for the cabinet end end plates) will be filled out WHILE YOU ARE ON THE PHONE.

4) Your credit card slip will be made out and read back to you.

5) You will be assigned a sequential order number. Number 101 means you will be shipped the 101st TNC 2 kit.

Due to limited supply and expected large demand, only one kit per person and one kit per call may be ordered.

After Office hours, an automatic answering machine will be connected to the telephone line. IT WILL NOT RECORD MESSAGES! It will, however, advise of the day's order status and shipping status by order number. Thus, in less than a minute, you can find out if your order was shipped, if any orders are still being taken for the following day, and how many TNC 2s are still available.

We hope this procedure minimizes any inconvenience to you, and we will do our best to ensure that no orders are misplaced.

IF OUR SUPPLIERS DON'T SLIP IN THEIR SHIPMENTS TO US, an additional 300 kits will be available in mid-September. If you require multiple units, or miss out on the 280 set for August, you may order against the September shipments. Thus, after the initial 280 units, it will be "business as usual."

Thank you for your continued support of TAPR and

The Packet Radio Revolution!

Attention, Doug Hardie and Bob Menton:

I have attempted to send the "longwinded reply" to Bob's question about radials to both of you via the net. If you do not receive it, lets see if we can figure out a working mail address path.

Others wishing to see a copy of the reply may feel free to request it. It gives a lot of intuitive discussion of what radials are supposed to do for you (3 different functions), why a quarter wavelength is magic, a lot of other ideas for very effective wire antennas for HF DX work, etc. I thought it a bit long to just inundate the net with it gratis, but it might be useful to some subscribers.

-John S., W3IKG

P.S. - Keith -- is it feasible to put it into the archives without putting it on the net generally? Or maybe I should just do that and give the net some exercise?

Remember these postings from earlier this summer?

6.9330 call?_____unidentified: bootleggers in 3 way CB-type conversation, one was mobile, at least one employed as a truck driver , ids= "9", "10", and "13", used Q signals but no call letters, lsb, 5/15/85 @0100Z [location?] (B. Parnass)

call?_____unidentified: bootleggers in CB-type conversation, talked of mobile antennas and nearby RTTY QRM, ids= "13", "33 " (Dave), lsb, 5/19/85 @0024Z [location?] (B. Parnass)

These stations were on almost daily, and often used the word "Oscar" before their numeric identifiers.

Who are they? What happened to them? In the August 1985 issue of Monitoring Times, Bob Grove sheds some light on this group in the following article:

FCC Closes Illegal Net

"A nationwide network of illicit radio operators using lower sideband amateur equipment on 6933 kHz has been nipped in the bud by Federal Communications Commission personnel coordinated through the powder Springs, Georgia, monitoring station."

"Known as the 'Oscar' group, the net members used unauthorized identifiers like Oscar 1 (net control

station), Oscar 5 (North Winchester, Indiana), Oscar 10 (Ridgetop, Tennessee, near Nashville), Oscar 13 (Groveland, Indiana), and Oscar 33 (also near Groveland)."

"The operator identifying himself as Oscar 10 has been closed down and the FCC made an announcement over the air to other net members of that fact. Continued violations will result in continued prosecutions."

"Upon issuance of a Notice of Apparent Liability, the Ridgetop resident faces a fine of $700 for unlicensed operation and an additional $300 for operation in an aviation band. Depending upon the disposition of the case by Washington officials, a maximum fine of $10,000 can be levied for unauthorized use of the airwaves."

SSTV signals were copied at KA9Q from W0ORE aboard the space shuttle Challenger on two consecutive passes this afternoon (approx 5:30 and 7:15 pm EDT). With a KLM-14C and GaAsFET preamp, signals were good, but not overly strong (i.e, full quieting, but not pegging the meter). The signal is FM at 145.55 mHz and consists of slow scan television interspersed with the

tone CW ID "W0ORE/CHALLENGER".

Based on antenna pointing and doppler, tracking is about 1.5 minutes behind predictions based on the last set (set 5a) so it ought to be usable at least until a possible orbit change takes place tomorrow.

As with the STS-9/W5LFL flight, PLEASE avoid any and all transmissions on 145.55 mHz!

Phil

Lines: 229

Protecting one building or tower from lightning is fairly straightforward:

1. First order protection -

On the tallest object associated with your structure, mount an extended umbrella-like fixture a few meters in diameter, with numerous sharp points along the periphery and across the crown, spaced about 1 meter apart. (You can make the thing from re-bar and heavy duty chicken wire unless you have high winds like we have around here.) Use a large diameter conductor (1 to 2 cm.) to connect the umbrella points together at the center and thence down to a suitable ground stake located at a place where soil moisture is prevalent, but more importantly, try to make the conductor run in a straight line with *no* sharp corners; use a minimum radius of 1.5 meters on any bends in the ground wire. Keep this wire at least 2 meters from any power or communications conduit at all places along its route.

Theory:

The multitude of points will emit a trickle corona continuously, resulting in a space charge of ionized air within 20 meters of the umbrella. The space charge will terminate the cloud-to-ground

electric field across a broad hemisphere and will reduce the local field gradient to a value below that needed to form "leaders". The umbrella will likely not ever be hit by lightning; however, the conductor gauge is set to minimize the damage inherent in such a strike. (A strike, if it occurs, will likely be a secondary, (resulting from the shift in electrostatic field just after a strike) to another object within a fraction of a km.) This approach, you should note, puts additional stress on your neighbors (they will see a slight rise in their hit statistics) as it only postpones the discharge until the cloud has moved past your installation. The ground conductor is spaced from other conduits so that the Electromagnetic Pulse (EMP) associated with the 10000 Ampere surge will not be able to develop equivalent currents in parallel conductors adjacent to the ground wire. Using a large diameter and avoiding bends reduces the per length inductance discontinuities. This discourages the abandonment of your ground conductor in favor of nearby metal objects such as power conduits (resulting in hazardous elevation of the system ground potential to thousands of volts above the mains).

2. Second order protection -

Protect your primary power entry by use of a surge protector having four main elements

a.) Line fuses for each hot main NO FUSE FOR THE WHITE NEUTRAL. No circuit breakers (too slow).

b.) Self extinguishing gas discharge tubes or arc chutes routed to a primary ground stake *separated* by 3 or more meters from the umbrella ground mentioned above, *not* using the same stake, even, and using the same linear routing algorithm mentioned above.

c.) Heavy gauge inductors, 1 microhenry or thereabouts for typical 30 to 50 Ampere per phase service levels, to choke the surge out of the consumer side of the system. NONE IN THE WHITE NEUTRAL.

d.) Post choke line clamping to WHITE NEUTRAL. This is where the witchcraft comes in. One candidate is the Metal Oxide Varistor (MOV). They have two disadvantages: They age, gradually reducing their threshold over time until one day they evaporate in a ball of fire during a line surge. They have a rather remote threshold characteristic compared to, say, a Silicon TransZorb. They have several advantages: They are cheap. They come in packaging that is familiar to professional electricians. They are generally more robust than Selenium or Silicon protectors. They have a smaller geometry than a Selenium protector. Another candidate is a combination protector made up from a ground referenced 50 Ampere triac in series with either a lower rated voltage MOV or TransZorb element, with the triac gate wired back to (an artfully positioned) tap on the gas tube/arc chute ground. From here (this stuff belongs in a fire-rated NEMA box) the WHITE NEUTRAL and GREEN NEUTRAL are tied together at this one point only, and passed through a medium size conductor to the

primary ground stake by a route that is separated by 1.5 meters from the gas tube/arc chute ground.

Theory:

If your power line gets hit, the gas tube fires and conducts the surge current to ground. The 20 kilovolts experienced by your service entry (for about 10 microseconds) will go through the chokes and will cause the MOV or complex protector shunt to break down and draw a steadily rising current (to many tens of Amperes), but immediately choked to a reduced voltage. The fuses will, after a while, be blown away. Until then, the MOVs will clamp the WHITE NEUTRAL to the mains (perhaps resulting in noticeable rise of the common-mode voltage). It is this common-mode elevation which destroys your out-of-building communications interfaces. With everything in the building coming to 2000 volts above your neighbors (including your local telephone operating company), any common-mode paths will be severely stressed. However, especially withing the building, they will be less stressed than they would have been if the mains were allowed to diverge from the WHITE NEUTRAL.

3. Third level protection

The most effective common-mode protection is an Ultra-Isolator Transformer. It is also rather expensive compared to differential line protectors and secondary Silicon TransZorb protectors. Although many Ultra-Isolator Transformers were utilized during the 1970's by sensitive computer installations, it was realized eventually that the most damage to main-frame equipment was done by differential surges (main to main on three-phase systems). The common-mode threat was seen as too little to justify the cost and complexity of installation of an ultra-isolator, which, by the way, can also be done ineffectively, resulting in no net improvement in the level of protection. The companies that make ultra-isolators issue complete and effective instructions concerning their installation. The difficulty is in getting industrial electricians to follow the directions. Thus for the benefit of the main-frame and peripheral power supplies, for cost effective purposes, a good differential surge eliminator inside the enclosure of each system power supply is recommended. However, remember that the common mode is the most destructive to your distributed data communications peripherals; unfortunately, to protect them you must provide the entire computer room and distributed CRT terminal load with an ultra-isolator transformer, or see that each unit is designed to withstand momentary local and global differences of thousands of volts on the signal returns. Even then, on occasion, only one violator located in a critical location and tied to a non-isolated power system elsewhere in the building can blow the whole scheme.

Theory:

Not much theory here. The entire primary winding of the transformer may get lifted to 2000 volts, but the secondary remains referenced to

the computer room ground stake. The box shields around the the windings are tied to the stake, and short out the electric field that might otherwise couple to the secondary. Saturation of the transformer core protects the differential mode. The differential protectors installed in each power supply dissipate the surges locally and since each takes a small part of the surge energy, no concentration of damage will likely occur.

4. Fourth order protection

You may get surge protectors for all communication lines leaving the building. Each will need a reliable path to a stout ground. (DEC usually specifies that the computer frame GREEN WIRE ground be done with a heavy gauge wire, and all surge protector grounds be separately returned to the distribution transformer secondary neutral grounding point.) You may add Silicon TransZorbs to power supply rails in data communications equipment.

Theory:

If one of your comm lines gets hit, or gets involved in an induced surge, the elevation in voltage not dissipated by the protector is conducted through the internal diode clamps included in most IC line drivers and receivers to a ground or supply rail, and thence to a TransZorb (a back-to-back zener with a heavy silver anode and thermally conductive silver leads). If enough protectors are in place, the common-mode surge is clubbed to death by the collective capability of all peripheral surge protectors operating together.

And that about does it. Needless to say, if you do a good job of protecting your site, and one of your neighbors gets hit, you may be damaged anyhow by currents resulting from the elevation of your neighbor's electrical ground. This is especially true in Hawaii (and even more so on their mountain tops) where the ground is made of lava rock. If you get hit by lightning, your entire site goes to 25000 volts with respect to the surrounding neighborhood. This bleeds down to appx 2000 volts over the next 100 microseconds or so.

If you have several buildings to worry about, such as may be the case for a university campus, putting an umbrella protector on every building will only cause the cloud to ground potential to develop to the point that when you finally do get a strike, it will be a *real killer*. It has been pointed out elsewhere that most lightning strikes are from the ground up to the cloud.

Thus, More Theory (speculation):

I suspect that the mechanism is something like this: Collisions of air molecules with each other and the things that make up the surface tend to knock electrons off the air molecules. There are other charge pair generation mechanisms as well, such as natural radioactive decay of Radon 222 and its decay products. (This specific mechanism is not my theory - see JGR Vol 90 No D4 Pgs 5909-5916 June 30, 1985, Edward A

Martell, NCAR.) The electrons, because of their charge, are sticky.
They cling to the surfaces of various semi-insulators (rocks and dry
dirt) and near the surface of conductors until enough of them are
implanted to provide a counter electrical field gradient to repel
later arrivals. The positive air ions are separated by thermal
energy, and molecular screening prevents the immediate recombination.
The charge separation is effected by the rising of the warmed
positively ionized air.

Once the charge is separated, mutual repulsion drives the electrons
into the conductive ground layers. Later, as the air rises and water
condenses, positively charged droplets accumulate in descending air
columns at the front of the storm just ahead of the rising column. A
field gradient is thus established with respect to the ground, where
all the electrons are. As the ground is conductive, the electrons
follow the cloud until, with the aid of conductive moisture and the
turbulence of the rising and descending air column interface, leaders
are established and a strike path is ionized and carried into the
descending air. The electrons travel up the path in a flash (parts of
which will have oscillations at radio frequency) and then distribute
themselves (at a more leisurely pace, accompanied with local flashes
and secondary flashes) in accordance with upper level gradients until
there is nolonger sufficient gradient to ionize the cloud-to-cloud
paths.

Time scales:

Main strike and individual secondary strikes each about 10
microseconds.

Duration of ionized path, reversals and secondaries about 100
microseconds.

Duration of high altitude electrical coronae readjustment about 1
millisecond.

Localized differences in the final potential may result in some
reverse strikes from a few overcharged negative clouds to the ground,
or subsequently more numerously (after air motion), cloud to cloud
"readjustments".

Well, I've done it again. Darn. If this is too long, I suppose you
should flame me for it, or if I am guilty of mis-representing known
(un)truths, that would qualify as well. But I wanted to at least try
to clear up the nature of lightning and its hazards a little.

Has anybody been able to copy acceptable SSTV from the shuttle? Here in Pittsburgh at W3VC, we've been able to hear faint signals on orbit #50, and much stronger signals on orbit #52, but nothing at all on any other orbit. Apparently, the SAREX experiment was not turned on as anticipated, and orbit #50 was the first orbit it was on. Both orbits were in "Mode 1" - auto SSTV downlink (no uplinks). The pictures we did get on orbit #52 were in the following sequence: four 8-sec B&W, one 12-sec color, one 36-sec color, then the cw id "W0ORE/CHALLENGER", sent at about 15 WPM. Then the sequence repeated. We were only able to hear it for slightly fewer than 3 sequences, and of the pictures we could see, the best were the B&W ones. But even though the signal peaked at s9+60 dB on the Yaesu FT-726R, the nulls were VERY deep, and this caused severe hits to the pictures. As far as we can guess, the pictures were of the shuttle bay doors and the IPS. We are using a GaAs FET preamp and either an Isopole or the 20-ele twist antenna of our OSCAR 10 setup. Tony is running only 2.5 w, but that should be quite enough. Also, on both passes, it was announced that SAREX would be on only MINUTES before the shuttle passed within our range.

I'm curious what sorts of experiences others are having. We have noticed that QRM on the downlink frequency is non-existent at this QTH (a far cry from the W5LFL mission!). Here is the germaine ARRL bulletin on the subject:

QST de W1AW
Hr ARRL Bulletin NR 65 From ARRL Headquarters
Newington Ct August 1, 1985
To all radio amateurs bt

The launch of space Challenger mission 51F took place at 2100.10 UTC on July 29.

Operation by W0ORE is now expected on the following schedule,

Date	Old Orbit Number	New Orbit Number	Start UTC	Stop UTC
Aug 1	47	48	1955	2025
	48	49	2130	2200

	49	50	2300	2320
Aug 2	50	51	0025	0125
	51	52	0155	0255
	52	53	0325	0405
	53	54	0500	0540
	54	55	0635	0705
	58	59	1300	1310
	62	63	1850	1900
	63	64	2010	2045
	64	65	2140	2220
	65	66	2305	2335

Keplerian elements for STS 51F are:

I.D.	Element Set 7
Epoch	85/212.59409722
Drag	2.5e-04
Inclination	49.4884
R.A.A.N.	146.3659
Eccentricity	.0006493
Arg. of Perigee	317.0027
Mean Anomaly	185.499
Mean Motion	15.86377915
Orbit Number	28
Semi Major Axis	6696.6766 Km
Anom Period	90.75
Apogee	319.5 Km
Perigee	312.3 Km
Beacon	145.55 MHz AR

To the ham who was looking for comments on 2m mobile xcvrs:
I recently sold a 7950 after having it in the car for a couple years
and overall was very happy with it as far as the features, etc. But
one word of warning...on high power it dissipates about 90 watts of
heat in the heat sink. Translate this to read it gets REAL hot,
especially in the summer when in a hot car. This 90 watts is derived
by looking at the DC current draw on high power (~10 A) and multiplying
this times the input voltage (13.8 V). This gives approx. 138 watts
DC draw from the power supply. The RF output power is 50 watts so the
delta, or 88 watts or so is dissipated as heat. What all this boils
down to is that you have to keep your transmissions fairly short in order
to prevent overheating. All the griping aside, the 7950 is a fine radio.
I think it was one of the first to incorporate the PL and transmit offset
into each memory. If I did it all over again I would buy the 7930 instead
which gives you the same features but no heat problem..

Can someone explain in simple terms how SSTV works? Also, what do
I need (other than a SW receiver and a TV) to receive it?

Thanks,
Richard Shapiro/BBN Labs/Cambridge Ma

I've heard good things about the Eavesdropper antenna and am
considering buying one. Does anyone have experience with one of
these? Also, my living situation is such that I CANNOT set it
up outside. In fact I can't stretch it out to its full length
at all. How effective will an antenna like this be sitting
doubled (or tripled) up on my porch? Will I do just as well
with a simple longwire?

Thanks,
Richard Shapiro/BBN Labs

     Jim:

     My  response to your query about 2m  fm transceivers
      was
     rejected by the 'seismo' postmaster.

     Try the Kenwood TR7930 or   TR7950.    The  guts  are  an
     improved  version of the TR7800, which I used for years
     and enjoyed.  I've recommended the    TR7930 to W9MAF
      and
```

KC2KO, both of whom are satisfied with the radio.

The audio amplifier/speaker combination in the ICOM IC27 series doesn't seem to be loud enough for mobile use, and I know 2 ICOM owners who had their audio stages fail.

I recall reading that Telcos will, on occaision, resort to filters and other devices to prevent a line from grossly exceeding specifications. Apparently, people needing short voice grade private lines were ordering alarm/telemetry lines and using them for voice. Maybe they got tired of complaints about "voice quality".

Anybody who requested and did not get the "longwinded reply about radials"
and who still wants it (given that it is VERY longwinded), please request it
again. I sent several copies of it out and got one or more cryptic messages
saying "Mail failed" but not telling me which copies didn't get sent.
Rather than send them all again I chose to issue this message. Apologies
to those who don't care about the message and didn't request it!!!

>
>   Dana Roode, WA6NGO

I have had no trouble in nearly 3 years now with rain leaking in. I
used a heavy application of roof patching cement (tar base stuff) under
the legs of the tripod. Then, after tightening down the threaded rod, I
put a heavy coat of the stuff all over the top of the tripod feet
covering the top of the threaded rod and the nuts. So far, not a drop
of water has come through.

I have, however, been wondering how to seal the holes if I take the tripod down. I guess I'll dump some more of this tar stuff over the holes.

Hope this is useful.

ICOM IC-R7000 VHF/UHF RECEIVER

ICOM announced their new scanning vhf/uhf receiver at the recent ANARC convention in Milwaukee. From the spec sheet given me, this radio will give Yaesu a run for its money.

The new R7000 looks just like its hf cousin, the R71A, with a keyboard and infrared sensor on the front panel. It covers 25-1000 and 1240-1300 MHz continuously, with conventional tuning or 99 memories.

There are detectors for FM, AM, and SSB. Both frequency and mode information may be stored into the memory channels, which are backed up by a lithium battery. I don't know if critical model-dependent parameters are stored in the RAM, as in the R71A, which would force the owner to send the receiver back to ICOM for reprogramming when the lithium batter fails.

As with the R71A, there is a fluorescent display with dimmer switch, a noise blanker, and a dial lock. The S-meter can also be used as a center tuning meter.

There are several switches to control scanning and searching modes, but nobody knows yet how well or fast it scans. There is a priority scan mode, which is not explained in the literature.

A rotary switch on the front panel selects tuning steps of 0.1, 1, 5, 10, 12.5, or 25 kHz. Other controls include an attenuator switch and a way to select/deselect memory channels for scanning (hopefully like a lockout feature, sorely lacking on the Yaesu). Narrow/wide filter selection is also provided.

Options include a speech synthesizer and wireless infrared RC-12 remote control unit.

Here is a copy of a past posting on this subject. I recommend
your friend buy the book "Monitor America."

==========

HOW DO YOU FIND THESE FREQUENCIES?
Part I:

Books, Magazines, Government Records, and Clubs

Bob Parnass, AJ9S

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger bookstores for about $7. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's new book, Monitor America, published by SMB Publishing, and available from Grove Enterprises for about $15. This single edition contains 582 pages of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 5th edition is available from Galaxy Electronics (Box 1202, 67 Eber Ave., Akron, Ohio) for about $15. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has

never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Copies of some of the FCC microfiche files are sold by Grove Enterprises. Buying from Grove is usually cheaper than buying directly from NTIS, although Grove doesn't offer all the files available from the government.

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche are available from Grove Enterprises for $25. In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government recently released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sells this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

In 20 years of being an amateur radio operator, and belonging to amateur radio clubs, I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $16.50 per year, which includes a monthly newsletter of about 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

The Scanner Association of North American (SCAN) is a scanner organization headquartered in Chicago. Having no elected officers or meetings, SCAN is not a club in the traditional sense, rather it is run by an advertising agency contracted by the manufacturer of Bearcat scanners. The $12 per year membership fee includes SCAN Magazine, a thin, albeit glossy, bimonthly.

Membership information is available from:

Scanner Association of North America
240 Fencl Lane
